

# Surface Water Response Modeling

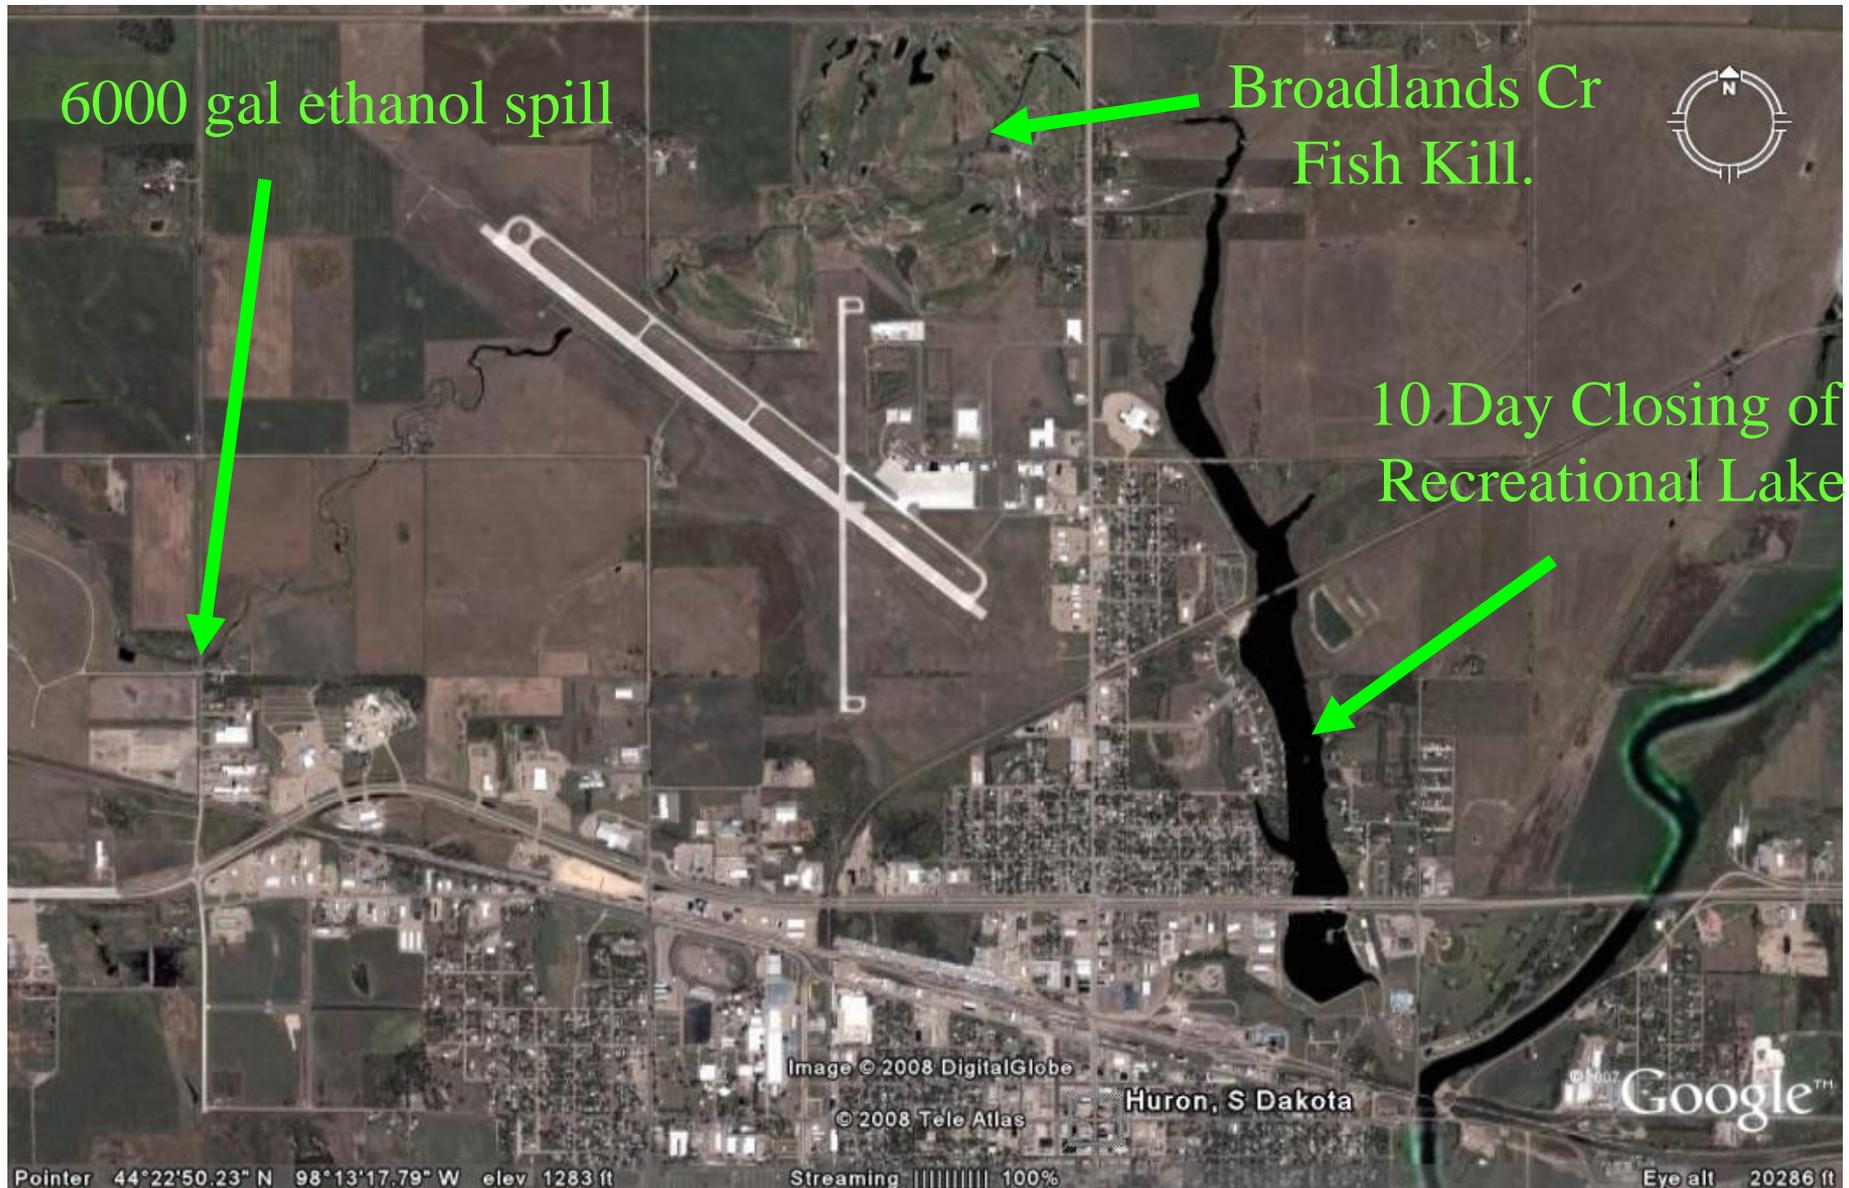

Jim Weaver, US EPA  
Office of Research and Development  
Ada, Oklahoma

# Co-presenters

- ◆ Susan Mravik, EPA, ORD-Ada
- ◆ Stephen Kraemer, EPA, ORD-Athens

# Huron, S.D., May 17, 2008

# Goals

- ◆ Surface water spills:
  - How fast does it get downstream?
  - What will be the concentration when it gets there?
  - Do I need to worry about that drinking water intake?
  - Can I plan a response?
  - Can these questions be answered quickly enough to matter?
- ◆ Two approaches:
  - Empirical tracer data
  - Numerical model development

# First Approach: USGS Empirical Equations

- ◆ Based on hundreds of tracer experiments conducted in all sizes of rivers over the last 40+ years
- ◆ No calibration of model needed
  - Otherwise travel time and dispersion coefficients are highly uncertain
- ◆ “Unit Peak” concentration concept accounts for variation in
  - Mass loading
  - River discharge
  - Travel distance

Jobson, 1996, USGS  
Empirical transport equations:

$$C_{up} = 857 T_p^{-0.760} \left( \frac{Q}{Q_a} \right)^{-0.079}$$

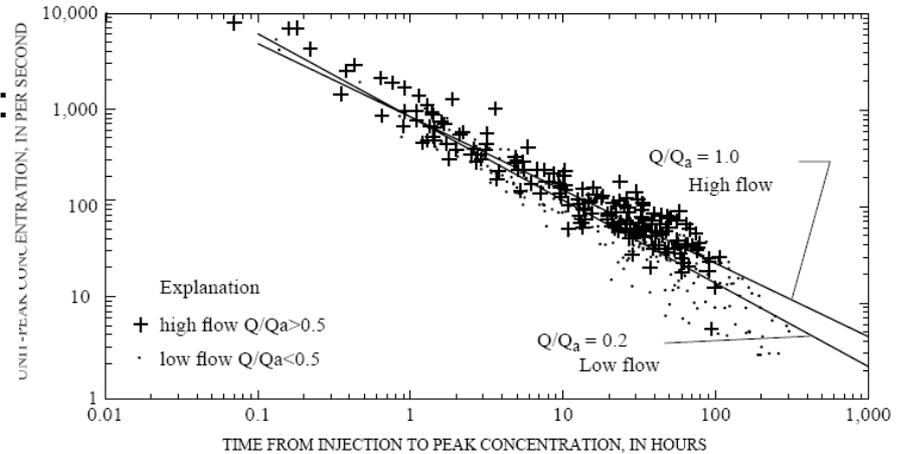

Figure 3. Unit concentrations as a function of traveltime with equation 7 plotted on the figure for two values of  $Q/Q_a$ .

$$V_p = 0.094 + 0.0143 \times (D'_a)^{0.919} \times (Q'_a)^{-0.469} \times S^{0.159} \times \frac{Q}{D_a}$$

Calculations depend on:  
Ann. Discharge,  $Q_a$   
Discharge,  $Q$   
Drainage Area,  $D_a$   
Slope,  $S$   
Distance

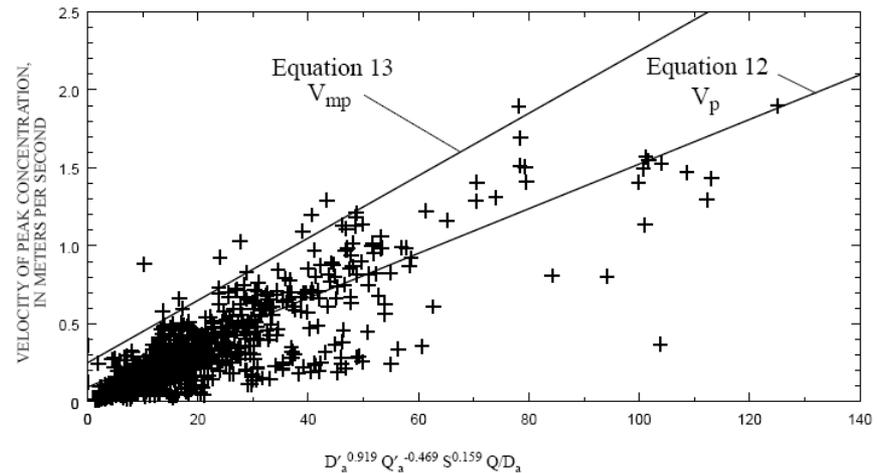

Figure 9. Plot of velocity of the peak concentration as a function of dimensionless drainage area, relative discharge, slope, local discharge, and drainage area.

# Extended Approach

- ◆ We are extending the original approach:
  - Multiple reaches of rivers – differing properties
  - Branching river networks
  - Continuous loadings
  - Loadings on different parts of network

# Monocacy River Tracer Experiment

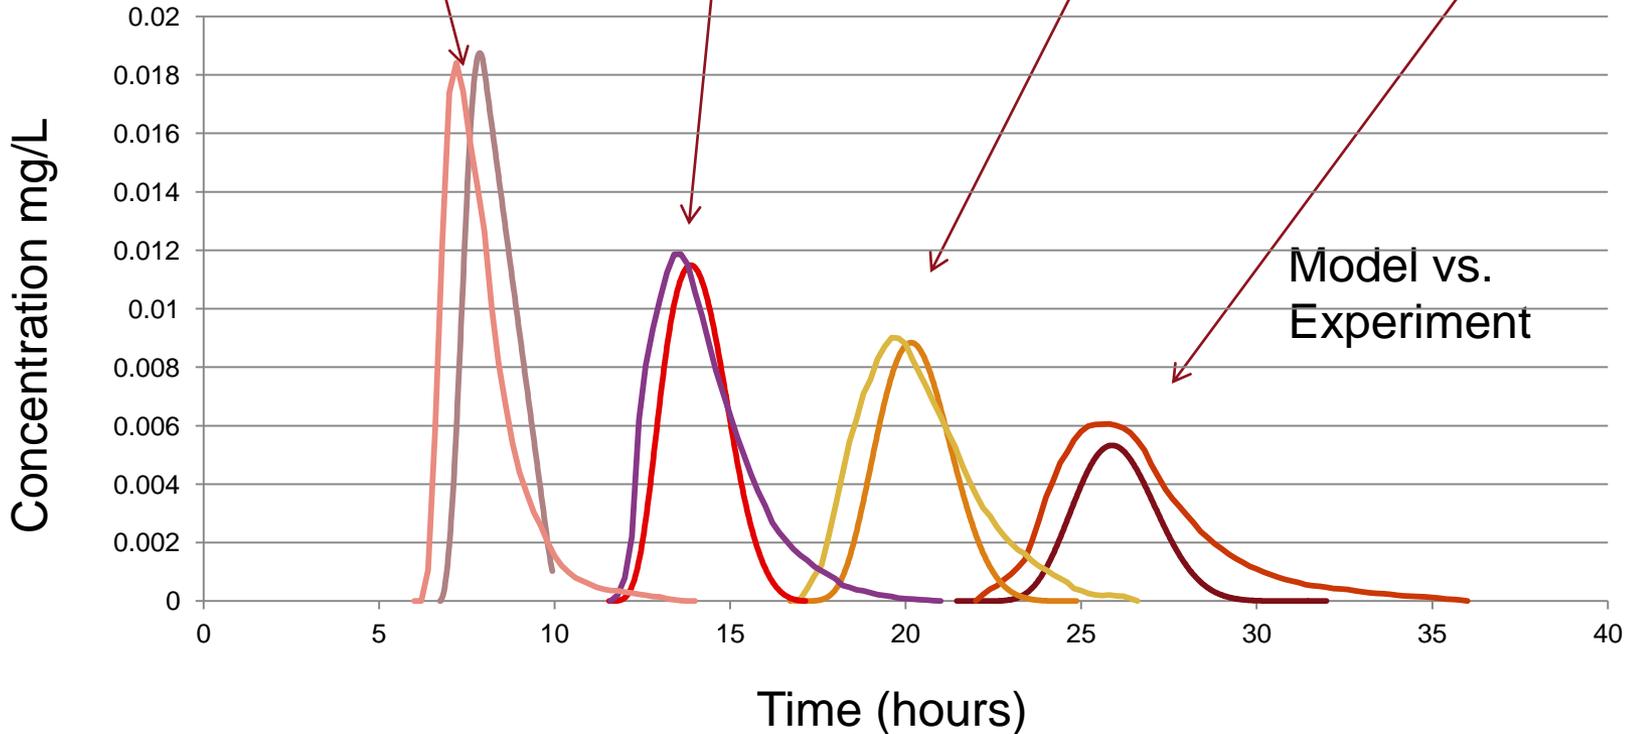

1.9 kg injected  
↓

Ann. Discharge 19.7 m<sup>3</sup>/s  
Discharge 14.3 m<sup>3</sup>/s  
Drainage Area 1586 km<sup>2</sup>  
Slope 0.00060  
Distance 10.3 km

Ann. Discharge 20.5 m<sup>3</sup>/s  
Discharge 15.1 m<sup>3</sup>/s  
Drainage Area 1650 km<sup>2</sup>  
Slope 0.00060  
Distance 18.35 km

Ann. Discharge 22.6 m<sup>3</sup>/s  
Discharge 15.9 m<sup>3</sup>/s  
Drainage Area 1819 km<sup>2</sup>  
Slope 0.00050  
Distance 26.80 km

Ann. Discharge 26.2 m<sup>3</sup>/s  
Discharge 18.5 m<sup>3</sup>/s  
Drainage Area 2115 km<sup>2</sup>  
Slope 0.00030  
Distance 34.28 km

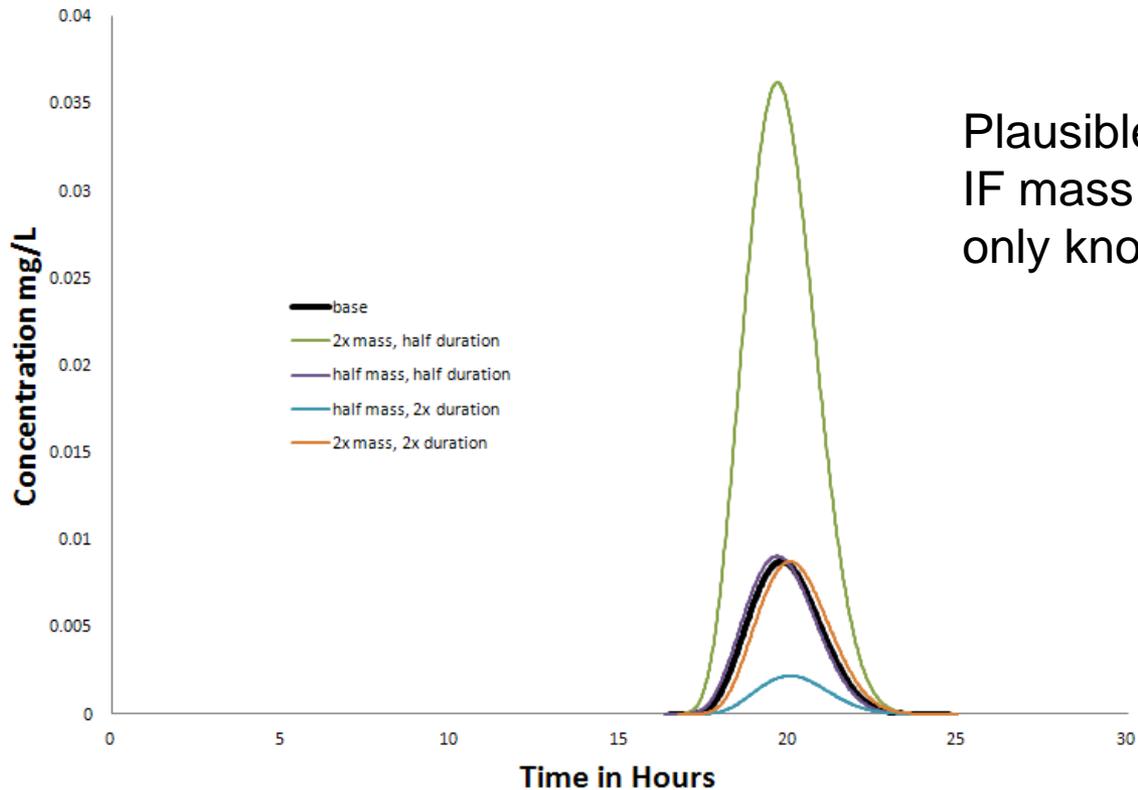

# Empirical Approach

- ◆ Limitations exist
  - Empirical equations do not include initial mixing
  - Do not include lakes, impoundments
  - Only simple (first order reaction) can be included
- ◆ Data needed:
  - River mile distance
  - Average annual discharge
  - Today's discharge
  - Drainage Area
  - Mass/volume of spill
  - Duration

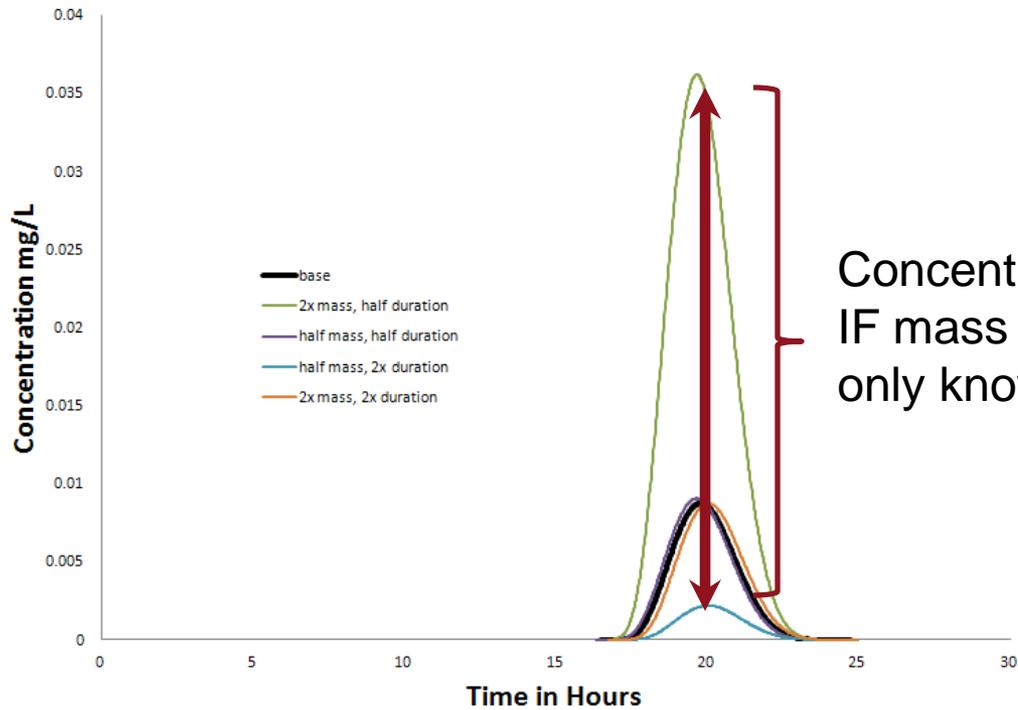

# Uncertainty in Mass and Duration

Monocacy Tracer Experiment Sensitivity Analysis  
3rd Section, 26.8 km

Plausible predictions  
IF mass and duration  
only known to factor of two

### Monocacy Tracer Experiment Sensitivity Analysis 3rd Section, 26.8 km

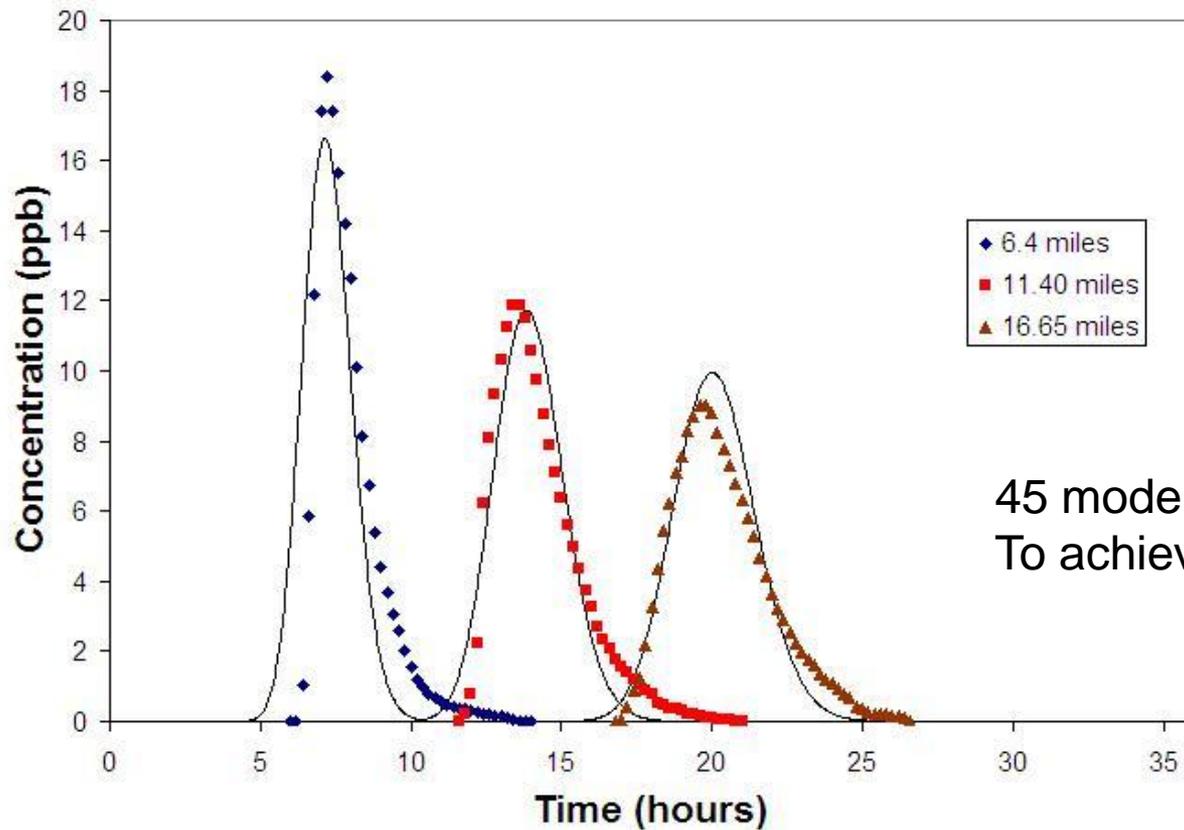

Concentration range  
IF mass and duration  
only known to factor of two

# Numerical Transport in Rivers

- ◆ Direct Solutions of partial differential equations
- ◆ Travel times
  - Not well estimated by simple point estimates of flows
  - Alternatively: use USGS regression equations
- ◆ Turbulent dispersion
  - Recent work has provided better estimates of dispersion coefficients
  - Alternatively: perform a tracer experiment
- ◆ Reactions
  - Flexible, but must characterize

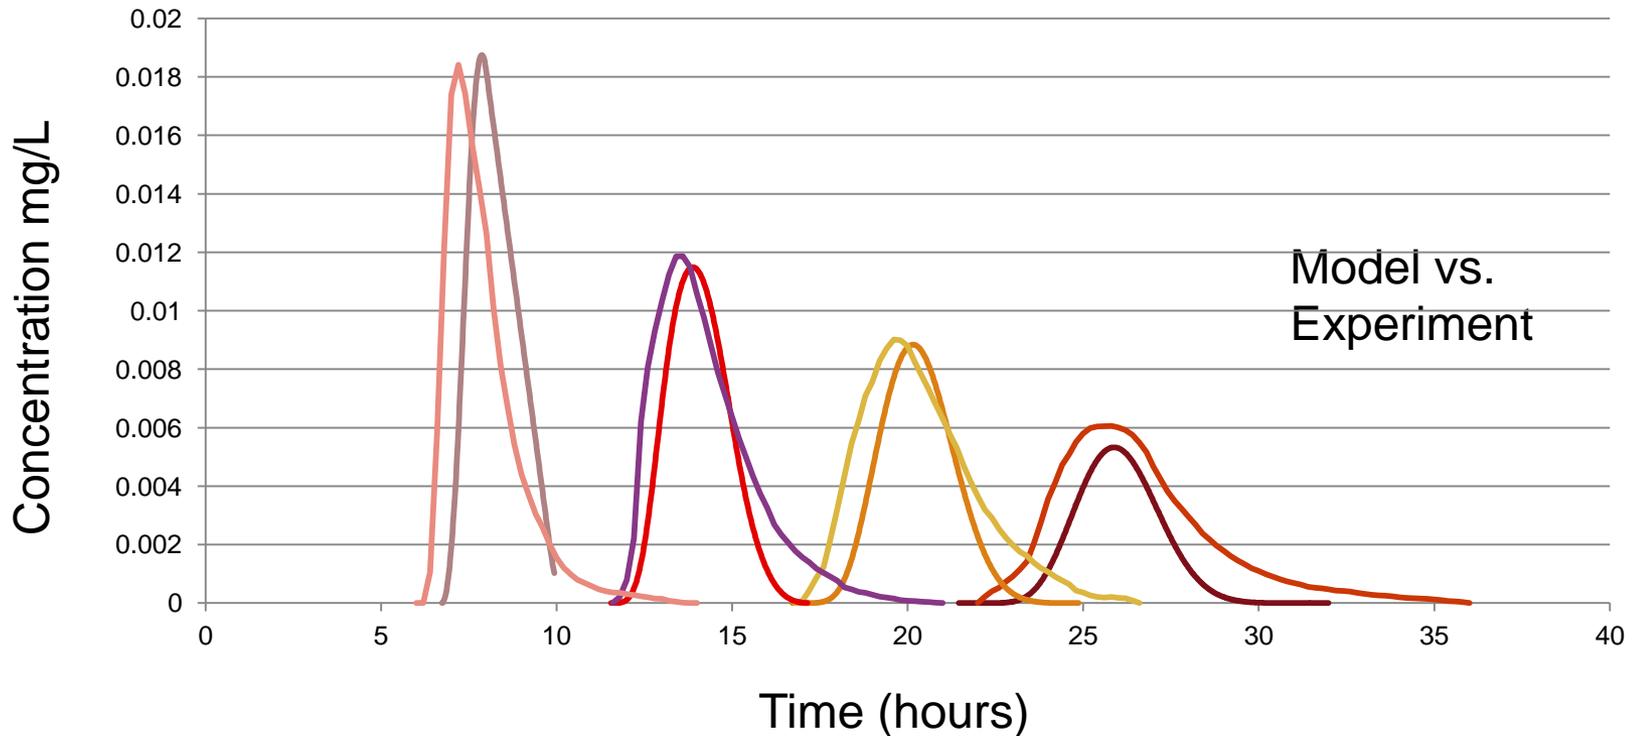

# One Dimensional Numerical Model

## Monocacy River 6/1968

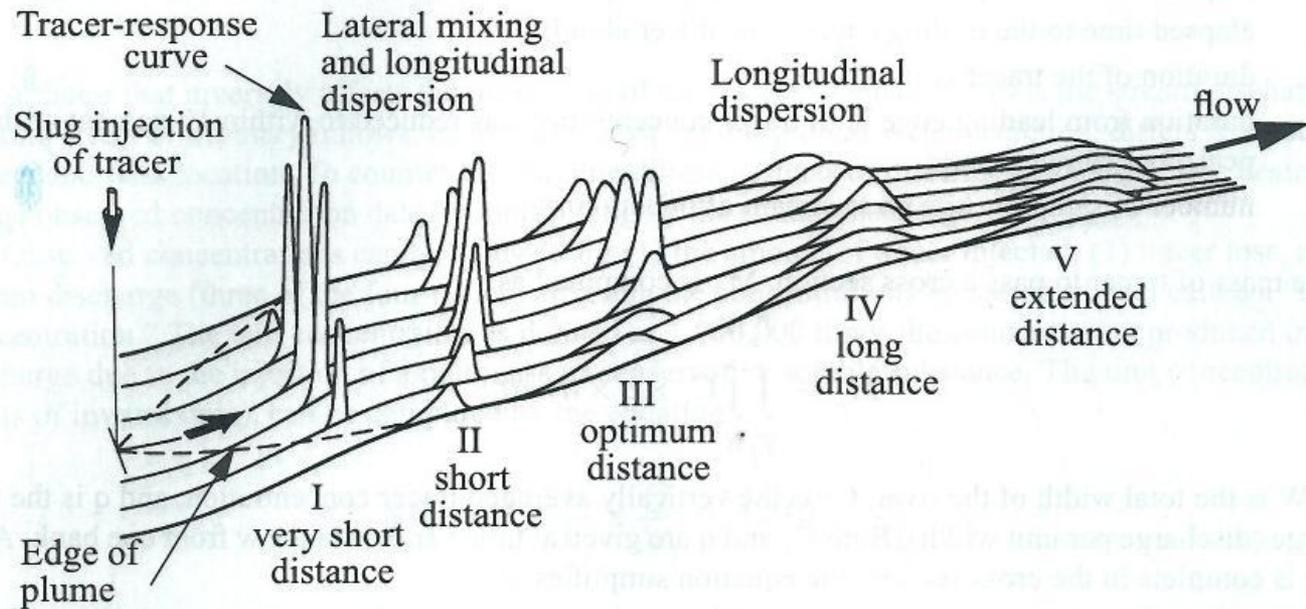

45 model runs  
To achieve calibration

# Monocacy River Tracer Experiment 1 run

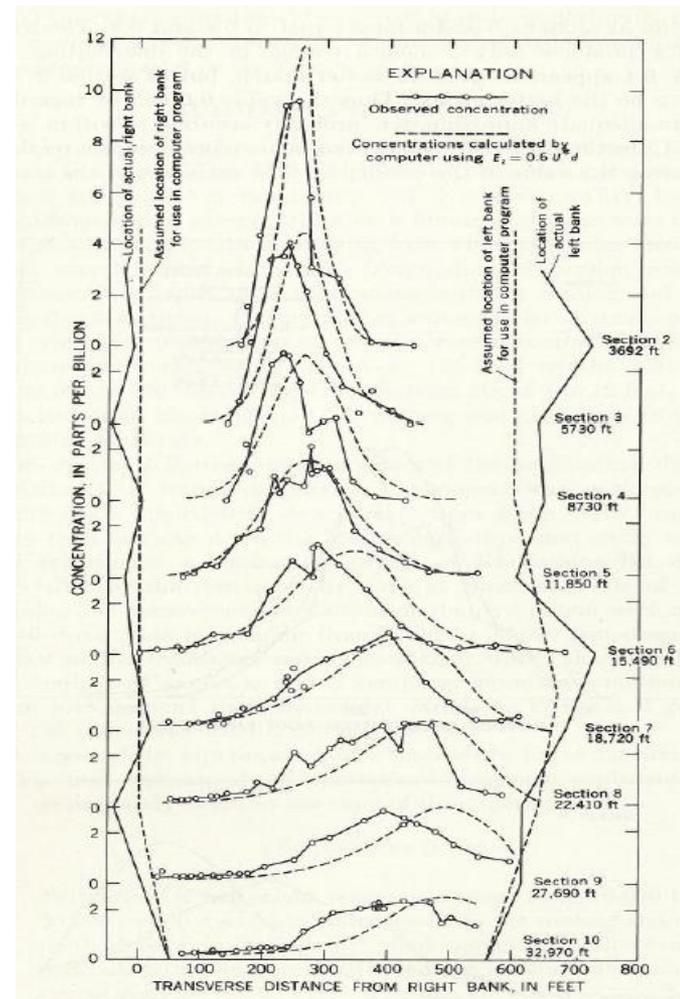

# Mixing Schematic (Jobson, 1996)

**Figure 1.** Lateral mixing and longitudinal dispersion patterns and changes in distribution of concentration downstream from a single, center, slug injection of tracer. (Modified from Kilpatrick, 1993, p. 2.)

# Missouri River Tracer Experiment

- Current numerical transport work focuses on simulating this experiment:
- Extensions:
  - Mixing at tributaries
  - Bubbling air/oxygen at places of refuge

# Summary

- ◆ Empirical-base model captures transport essentials
  - Data required on rivers
    - Drainage area, slope, discharge, annual discharge
  - We're developing data for a few river networks
  - (Should we do more?)
  - Modeling tool to be made available through web/smart phone
- ◆ Numerical models – more powerful, but data/parameter limited
