

Applying data mining approaches to further understanding chemical effects on biological systems

Chihae Yang, Ann Richard, Jennifer Fostel

March 28, 2007

Linking biology to chemistry

NTP High Throughput Screening

- A method to prioritize the selection of chemicals for NTP bioassays
 - Test chemical nomination procedure
 - rank or rule out “most likely toxic” and “most likely not toxic” compounds
- An approach to potentially obtain insights for mode of actions
- Predictive toxicology?

NTP HTS – Chemicals and assays

- Structures 1408 chemicals – 1340 selected in this study
- Biological assays
 - Activity: NCGC 10 strains
 - Caspases - 3T3, BJ, SHSY5, H4Ile ,Hek293, HepG2, HUVEC, Jurkat, N2A
 - IκB signaling, JNK Alpha
 - Viability: Fred (7 strains), NCGC (13 strains)
 - 3T3, BJ, SHSY5, H4Ile ,Hek293, HepG2, HUVEC, Jurkat, N2A
 - “Other assays” – NCGC (4 assays)
 - SKNSH, MRC5, Renal, Mesenchymal

Toxicity data used in this study

- Carcinogenicity
 - NTP rodent bioassays – mm, fm, mr, fr
 - FDA – mm, fm, mr, fr
 - ISSCAN – mouse, rat
- Genetic toxicity
 - Salmonella strains
 - Mammalian mutagenesis – mouse lymphoma, HPRT
 - In vitro chromosome aberration
 - In vivo micronucleus...
- Rodent acute toxicity
 - RTECS
- Endocrine receptor assay
 - NTCR

Filtering reactive groups

In 1340 chemicals in this study

Protein reactions	
Aldehydes	42
α,β unsaturated carbonyl (Michael acceptors)	74
α,β diketones	4
Dinitrohalobenzenes	6
Alkylating agents	
epoxide	33
sulfonate esters	4
sulfonyl halides	2
nitrogen mustard	4
acyl halides	14

Toxicity endpoints	counts
LD50 rodent	905
Carcinogenicity call	318
in vivo micronucleus	45
in vitro chromosome aberration	401
Mammalian mutagenesis	314
Salmonella mutagenesis	942

at compound level – not enough tox study overlaps.

Scatterplot Matrix

multivariate correlation

At compound level,
virtually not possible
to correlate any
activities or toxicity
data.

Representing structures with Leadscope molecular descriptors

Benzenes	
Functional groups	
Heterocycles	
Pharmacophores	
Spacers	
User defined features	knowledge addition

Applying a set of molecular descriptors to expand chemistry space.

Structure domain characterization by principal component analysis

using selected features present in >10 compounds

Principal Components – discrimination of NTP chemical space by mutagenic potential

Principal component scores: features (F=100 features selected by chi-sq)
red=Salmonella positive ($p > 0.5$), blue=Salmonella negative ($p \leq 0.5$)

Principal Components – discrimination of NTP chemical space by carcinogenic potential

Principal component scores: features (F=100 features selected by chi-sq)
red=Carc positive ($p > 0.5$), blue=Carc negative ($p \leq 0.5$)

Principal Components – discrimination of NTP chemical space by acute toxicity

Principal component scores: features (F=100 features selected by chi-sq)
(red=pLD50Rodent > -0.84, blue=pLD50Rodent ≤ -0.84)

Linking bioassays to toxicity through structural features

Structure-Features matrix is the mathematical link between the [T] and [A] matrices.

This is my mathematical premise for this approach.

very sparse chemical space for toxicity data

Structural features differentiating the profile

- 158 features are selected
- Z-scores are used to distinguish the activities

$$\text{z-score} = \frac{\text{class mean} - \text{overall mean}}{\text{standard error}}$$

- Multivariate analysis
 - Pearson correlations

$$r_{A_i T_j} = \frac{s_{A_i T_j}}{s_{A_i} s_{T_j}}$$

Examples of structural features

Chemical Features	%	3T3	Hek 293	Hep G2	JNK α	Jurkat	Carc _Call	pLD50
benzene, 1-R-,2-carbonyl-	7.7	2.81	- 0.64	- 0.10	4.46	-0.01	0.40	-2.78
benzene, 1-R-,2-alkoxy-	3.8	0.39	0.24	1.22	2.23	0.72	1.17	0.81
alcohol, alkyl, acyc-	8.4	- 1.48	0.94	0.32	- 1.23	0.84	-1.40	-2.80
alcohol, aryl-	11.9	4.36	2.17	2.04	1.56	4.58	-1.63	1.35
alcohol, cyclohexyl-	1.0	- 0.39	0.32	- 0.67	- 0.05	0.99	-1.25	2.72
carbonyl, aminomethyl-	1.0	0.60	1.65	4.20	- 1.47	2.81	0.43	1.63
halide, alkyl, acyc-	9.2	- 0.53	1.93	1.22	0.48	1.26	0.66	3.35
steroid, 13-methyl-	1.9	0.94	5.15	2.61	- 2.05	3.54	0.22	1.35

Scatterplot Matrix

Same endpoints correlation as slide #8, but using the molecular descriptors. Now we can start seeing some patterns.

Correlation between genetic toxicity and carcinogenicity

Salmonella – Carc: 0.52
ivtCA – Carc: 0.32
Salmonella – MMut: 0.49
ivtCA-MMut: 0.46
ivtCA-Salmonella: 0.65

3T3 and JNK with mutagenesis...

ivtCA-3T3: 0.39
 MMUT-3T3: 0.33
 Salmonella-3T3: 0.32
 MMut-JNK α : 0.38

Jurkat viability against Rodent LD50

Jurket-RodentpLD50: 0.68

Summary

- Correlations of bioassays and toxicity cannot be assessed at the compound level with the current toxicity database.
- Expanding structure dimensions to structural features or molecular descriptors, bioassays and toxicities can be mathematically correlated.
- Chemical selection (nomination) process for testing will benefit by incorporating chemoinformatics approaches.
- Further work is planned for gaining molecular level knowledge from these experiments.
