Outline

- EPA ToxCast Program
  - Developing new approaches to screening and prioritization of environmental chemicals
  - Addresses toxicity data gap
  - Reduces animal use
  - Anticipates NRC report on Toxicity Testing of the 21st Century

- ACToR – Aggregated Computational Toxicology Resource
  - Collecting all the world's publicly available *in vitro* and *in vivo* data on environmental chemicals
  - Includes deep yet-to-be-released toxicology data from EPA

ACToR and ToxCast
Addressing the Toxicity Data Gap

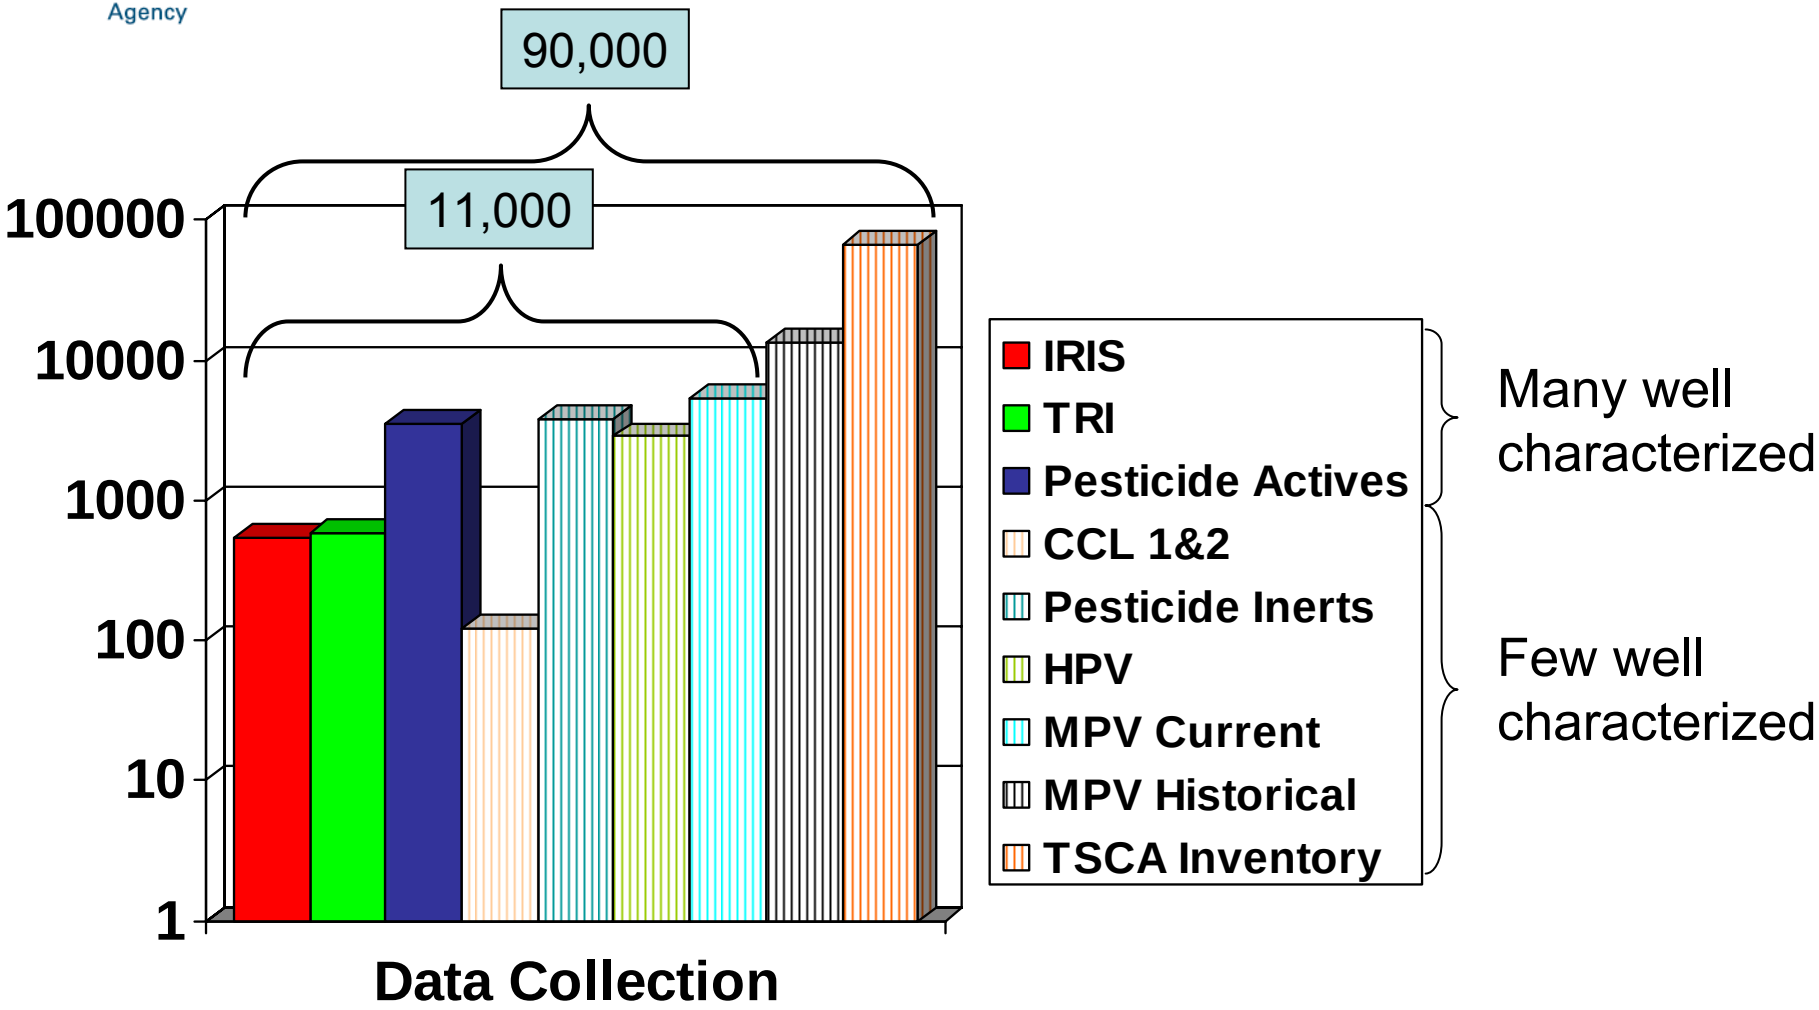
Complete toxicity package includes:

- Acute*
- Subchronic
- Chronic / Cancer
- Developmental *
- Reproductive *
- Immunotox
- Neurotox
- Genotox *
- Dermal
- Respiratory
- Nephrotox
- Endocrine
- Cardiotox
- Hepatotox
- Ecotox*

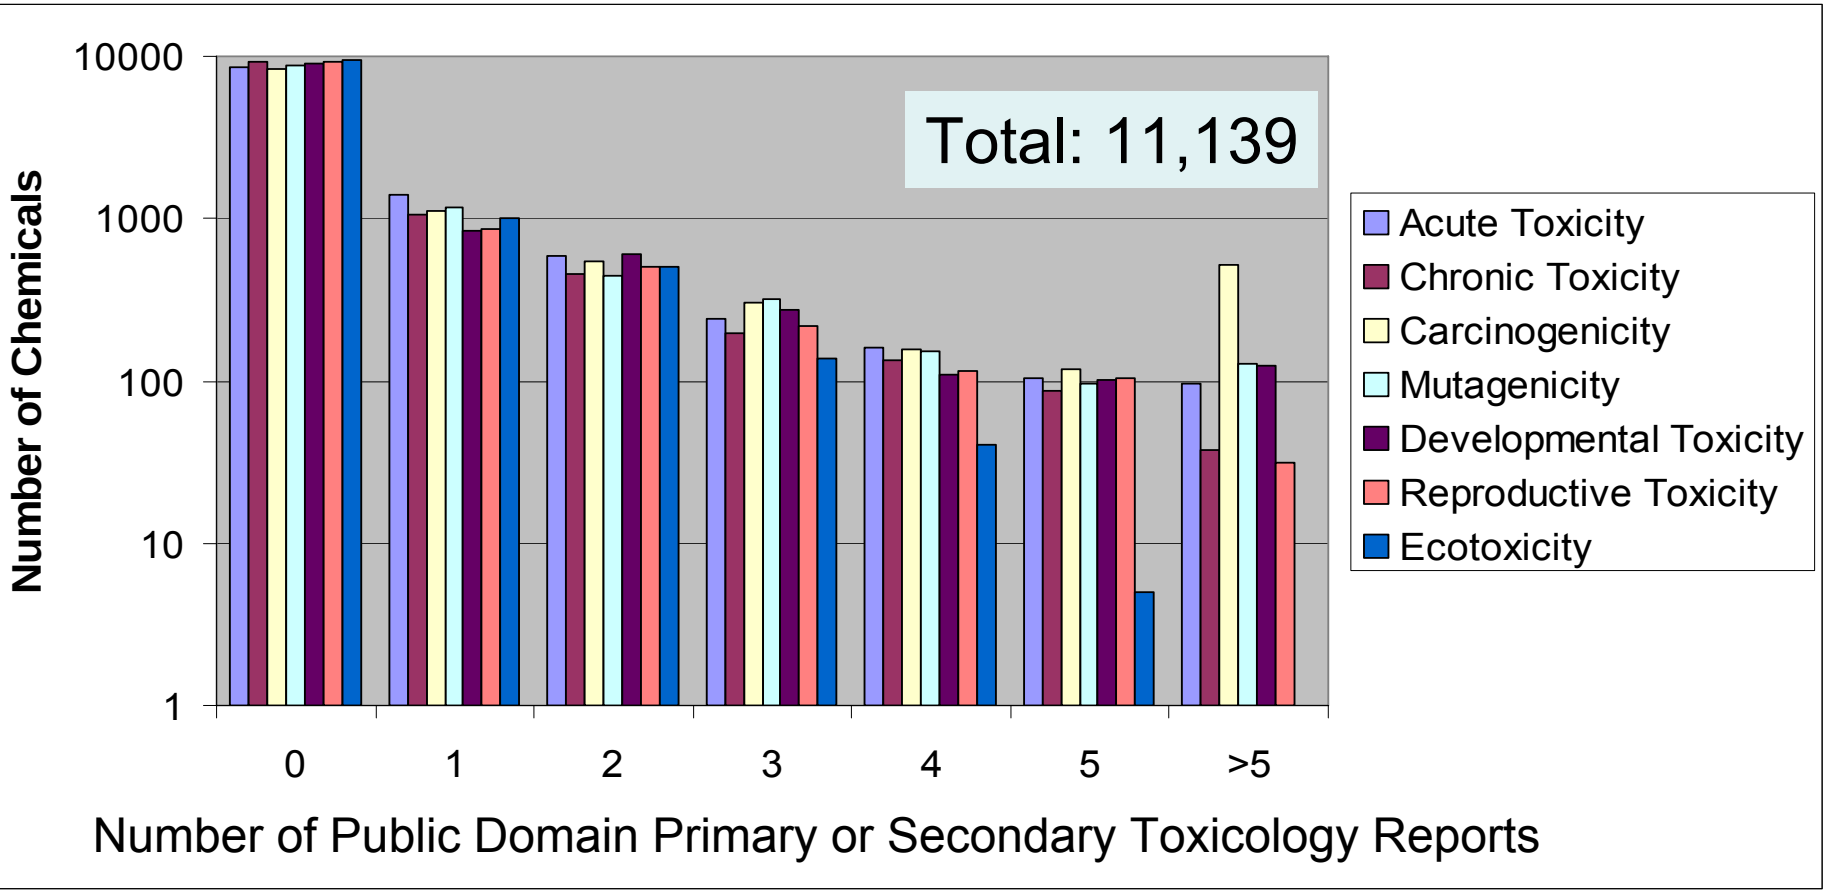
"Pesticide Food Use Actives" require all - $Ms/chemical

(*) Required for TSCA substances

The World of Environmental Chemicals



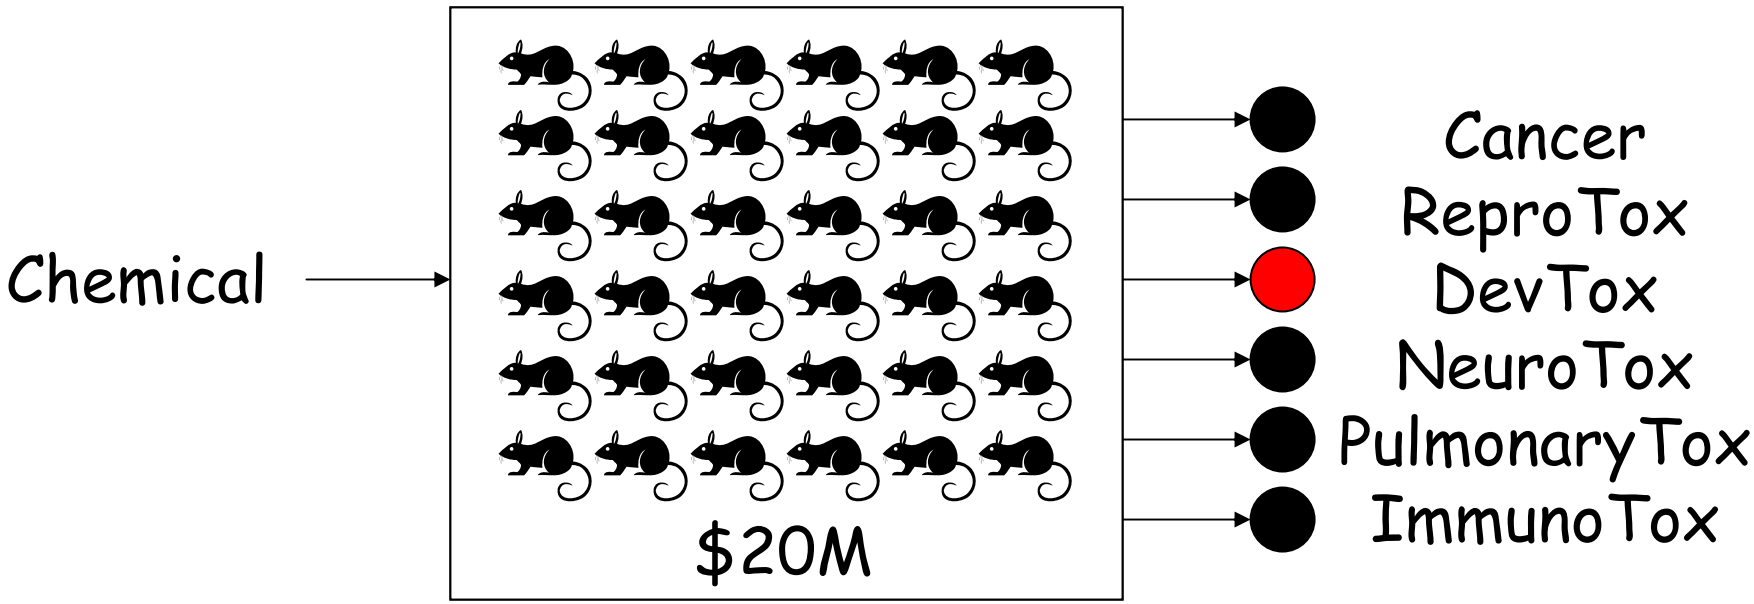
Current Data Coverage / Data Gaps for Widely-used Environmental Chemicals



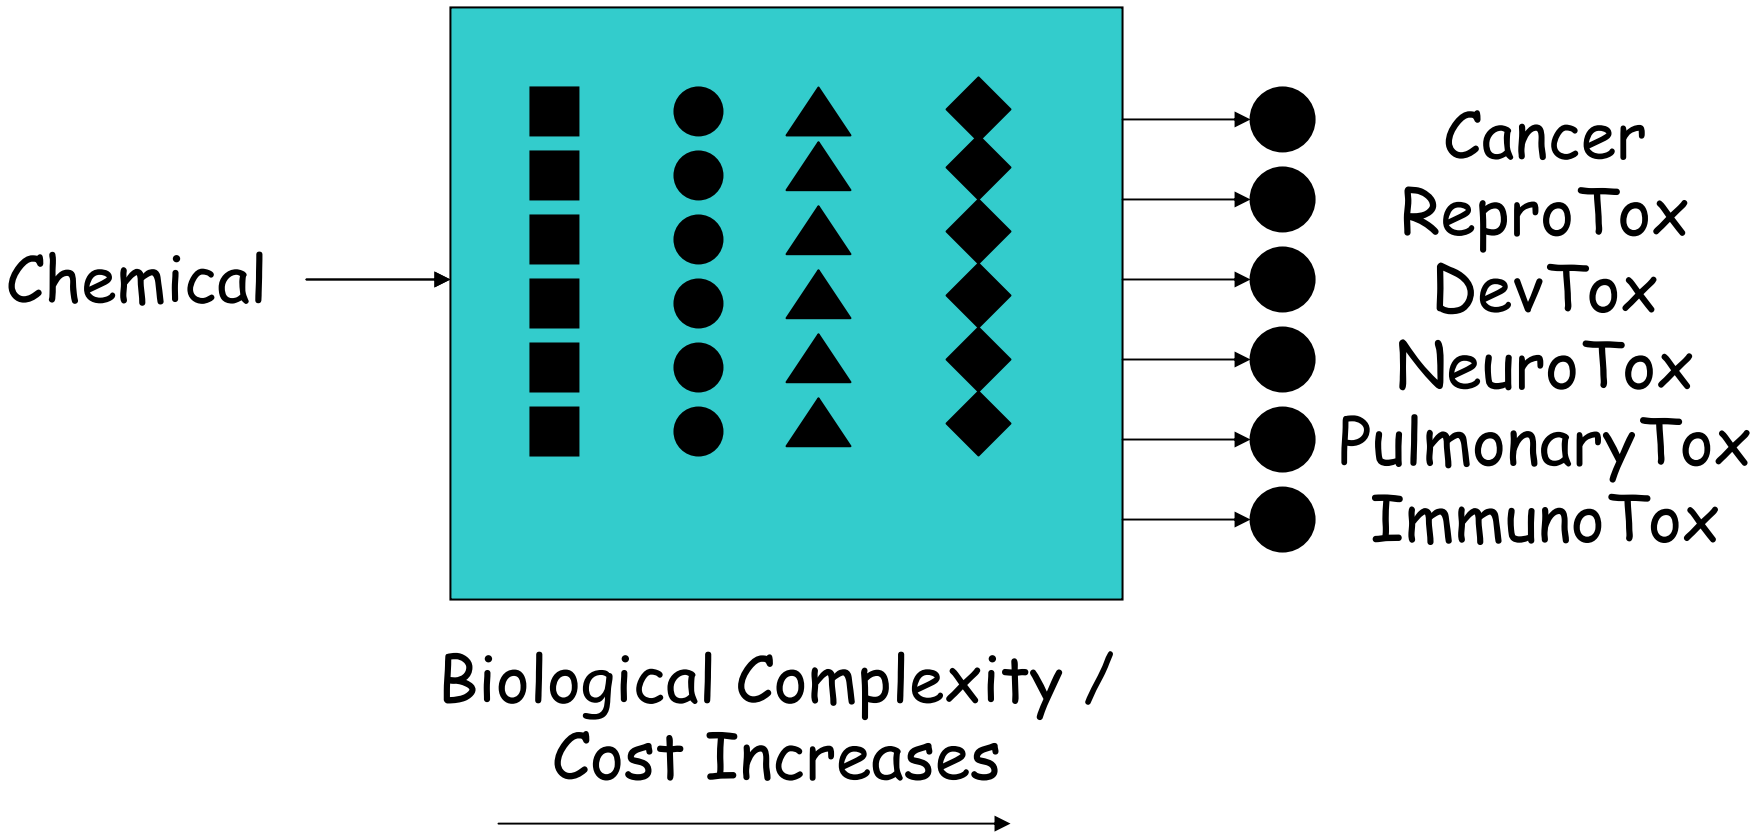
<10% have data for most tests

ACToR is the one-stop shop for this data

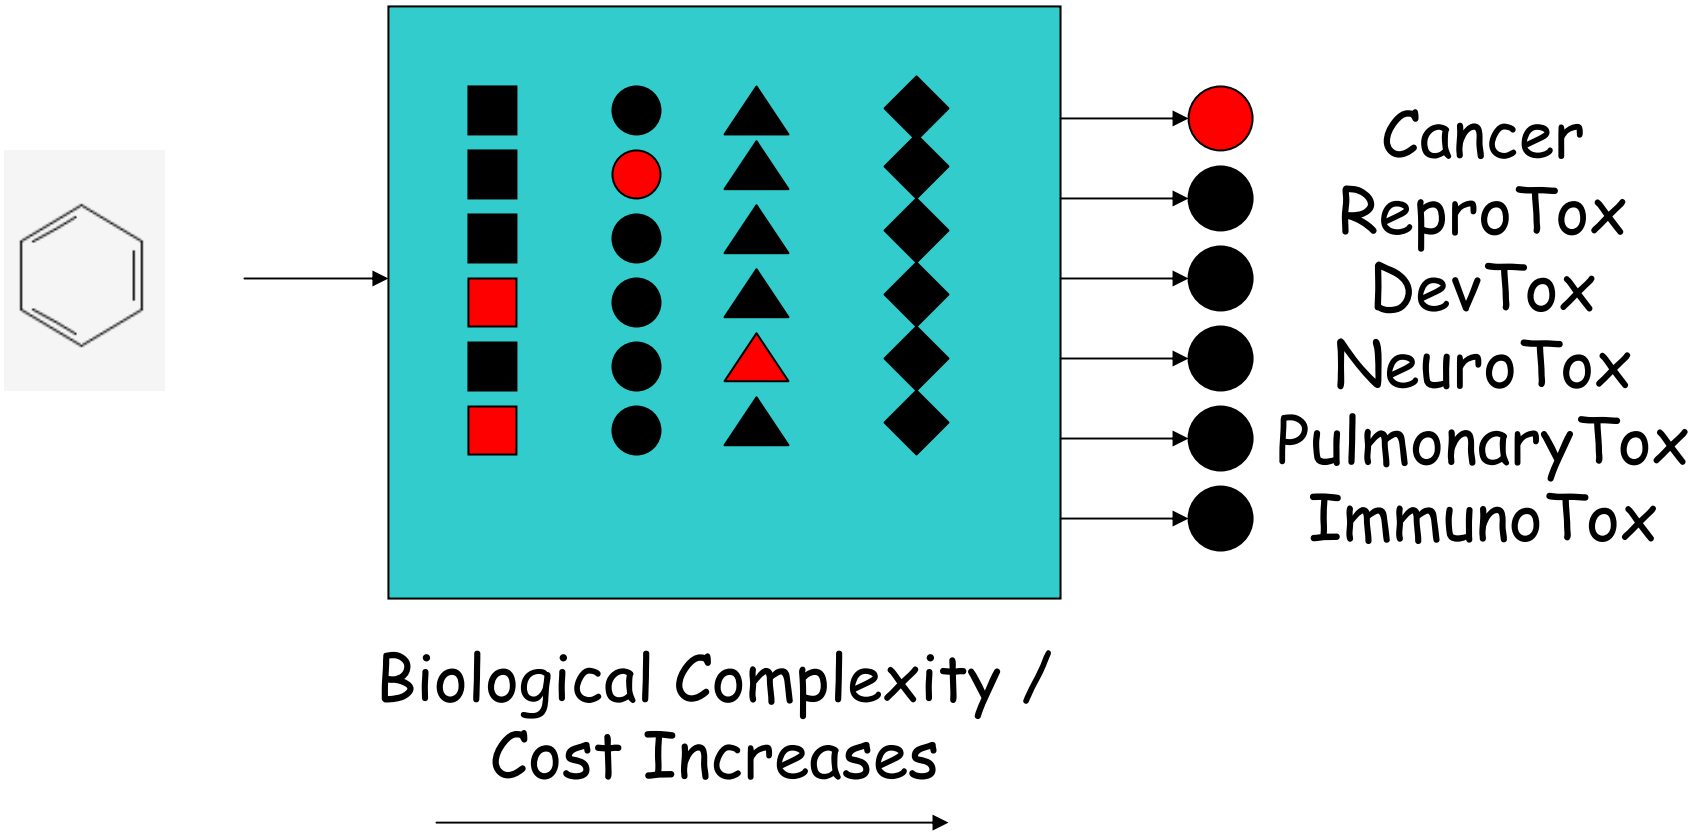
Toxicity Prediction Today



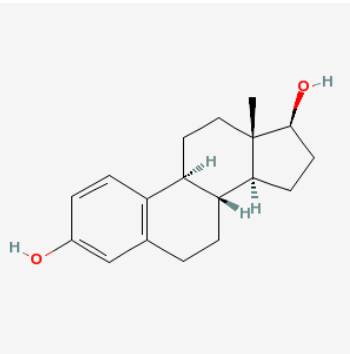
Toxicity Prediction Tomorrow: Find Pattern that Predicts Toxicity using Inexpensive Assays

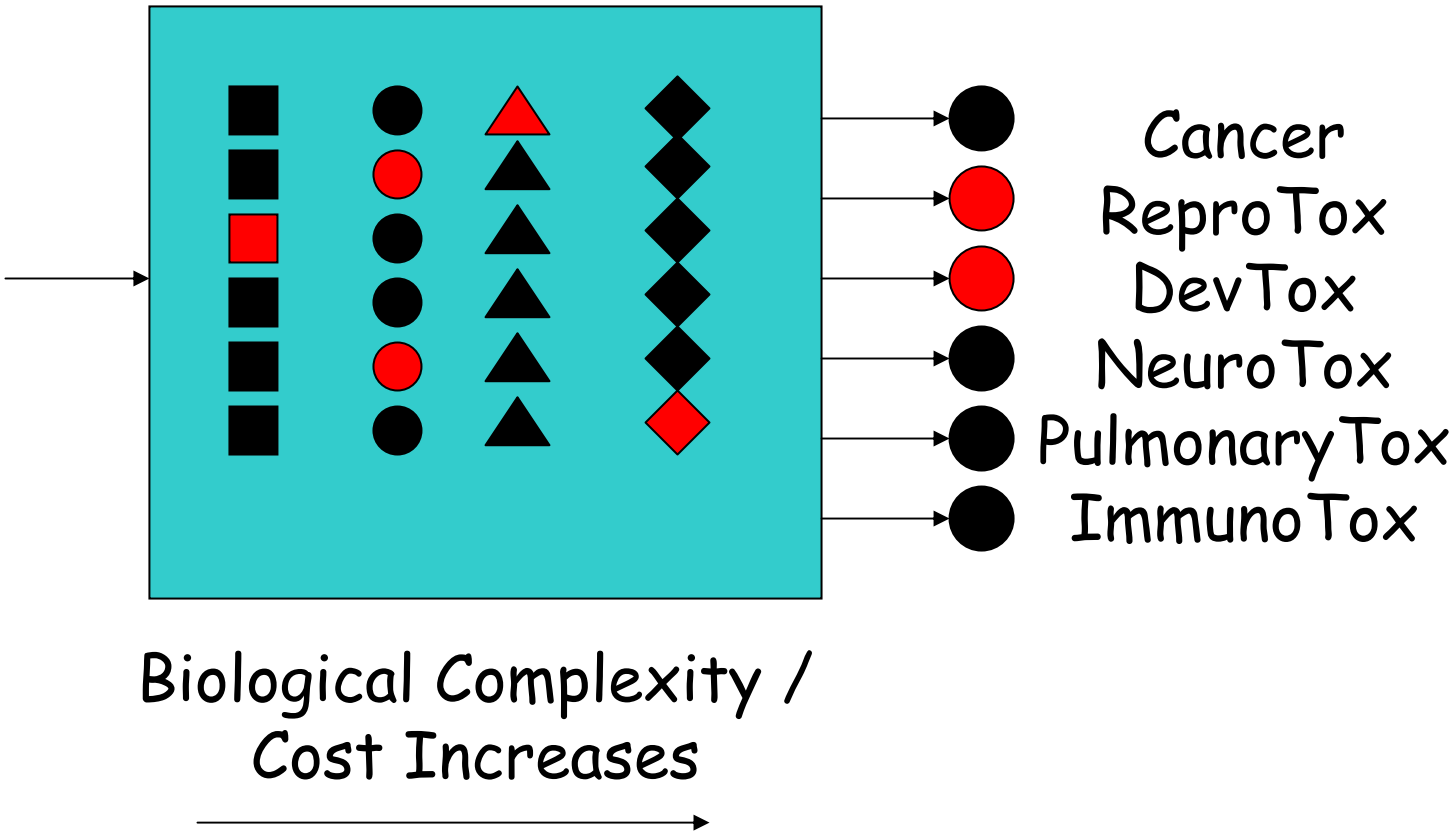


Toxicity Prediction Tomorrow: Find Pattern of Assays that Predicts Tox

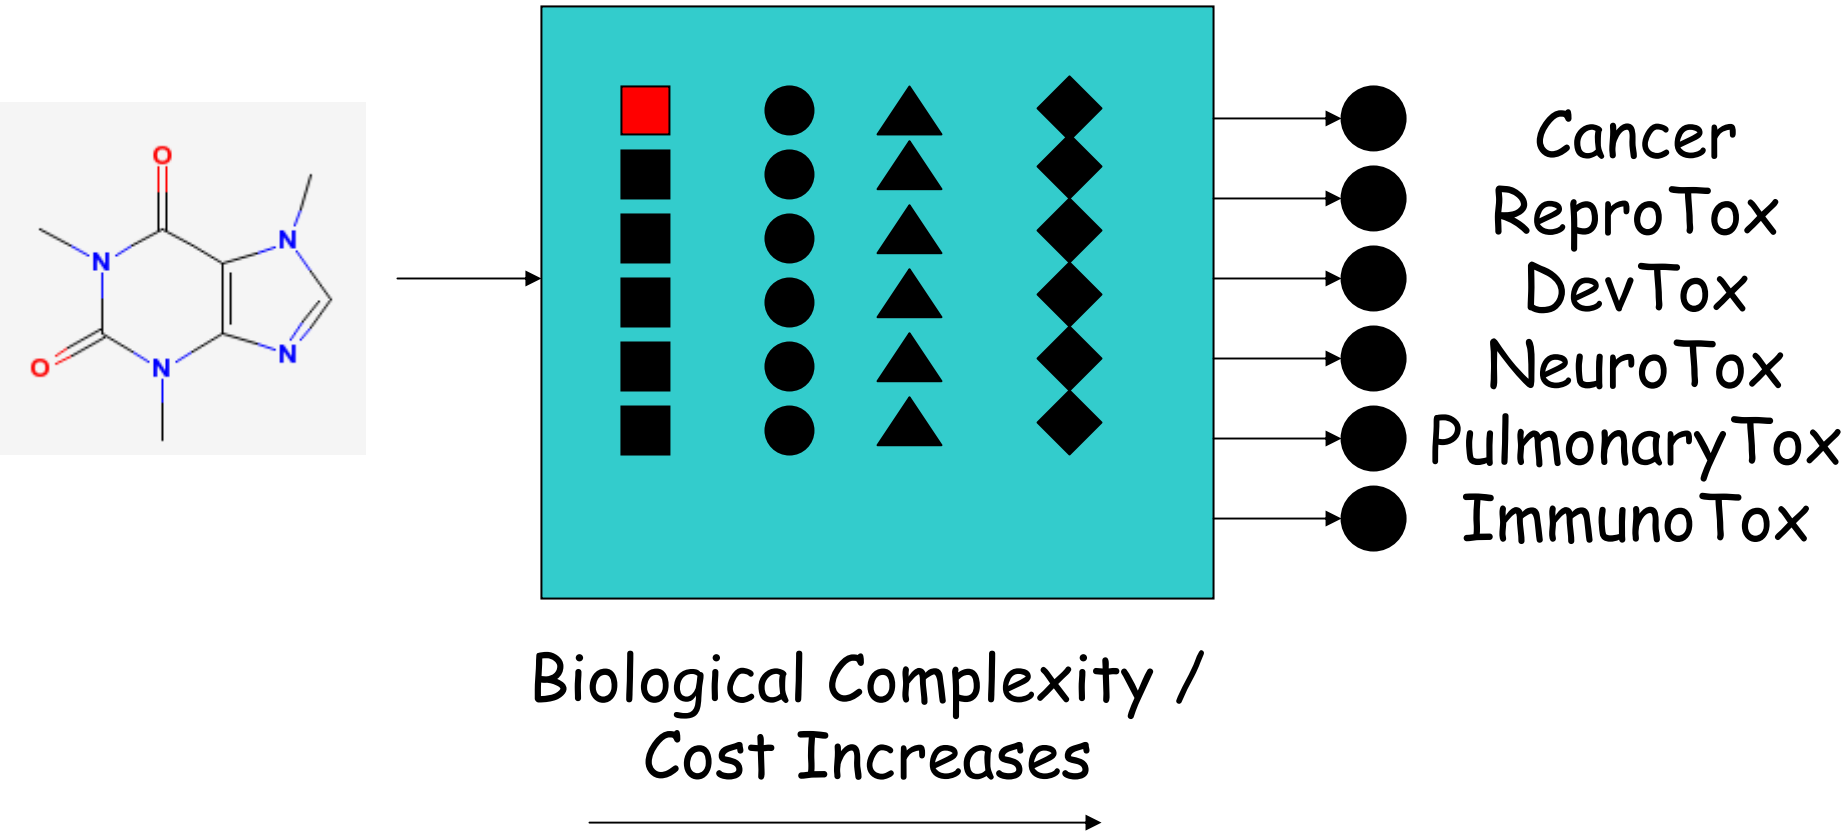


Toxicity Prediction Tomorrow: Find Pattern of Assays that Predicts Tox





Toxicity Prediction Tomorrow: Find Pattern of Assays that Predicts Tox

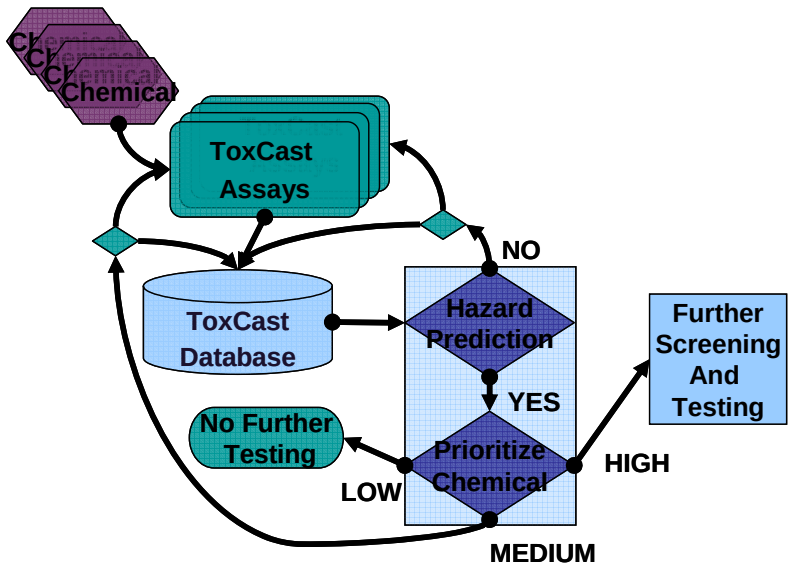


ToxCast Background

- Research program developed by EPA's National Center for Computational Toxicology
- Formulated to address chemical screening and prioritization needs
- Based on experience of the pharmaceutical industry
- Comprehensive use of current technology
- Phased approach to evaluate utility
- Committed to stakeholder involvement and release of data to public domain

Phased Development of ToxCast Program

Phase	Number of Chemicals	Chemical Criteria	Purpose	Number of Assays	Cost per Chemical	Target Date
I	>300	Data Rich (pesticides)	Signature Development	>400	$20k	FY07-08
II	>1000	Expanded Structure and Use Diversity	Evaluation and Extension	>300	$15-20k	FY08-09
III	Thousands	Data poor	Prediction and Prioritization	>300	$10-15k	FY10-12



- Delivers an affordable, science-based system for categorizing chemicals
- Increasing confidence as database grows
- Identify potential mechanisms of action
- Refine and reduce use of animals in hazard identification and risk assessment

Chemical Classes Investigated in ToxCast Phase I

291 pesticide actives with complete toxicity datasets
30 Carbamates (plus one metabolite)
33 Organophosphates (plus several metabolites)
12 Pyrethroids
12 Triazines (plus one metabolite)
17 Azole Fungicides (plus one metabolite)
13 Organochlorines
7 Phthalates (and several metabolites)
14 HPVs, 11 HPV challenge
56 of 73 chemicals proposed for Tier 1 EDSP

ToxRefDB

Reference In Vivo Toxicology Database

- Office of Pesticide Programs - Data Evaluation Records (DER)
  - 20 years of key primary toxicology data for industry submitted toxicology studies
  - Complete data package for >300 chemicals
  - High quality data with significant QC
  - Incorporate into relational model with expert-developed controlled vocabularies
  - Integrate other primary toxicology sources (NTP, OPPT, European agencies)

First effort to capture, tabulate and mine this unique resource

STUDY TYPE: Combined chronic toxicity/oncogenicity feeding – Rat
OPPTS 870.4300 [§83-5]

DP BARCODE: D257223 SUBMISSION CODE: S564270
P.C. CODE: 111901 TOX. CHEM. NO.: 497AB

TEST MATERIAL (PURITY): Imazalil (purity 97.4%)

CITATION: Van Deun, K. 1999. Combined oral chronic toxicity/carcinogenicity study with Imazalil in the SPF Wistar rat. Dept. Toxicology, Janss Foundation, 2340 Beerse, Belgium. Laboratory report number, 3817, June 8, 1999. MRID 44858001. Unpublished.

EXECUTIVE SUMMARY:

In a chronic toxicity/oncogenicity study (MRID 44858001), Imazalil (97.4% a.i.) was administered in the diet to groups of 50 male and 50 female H substrain (SPF) Wistar-derived rats at concentrations of 0, 50, 200, 1200, or 2400 ppm (equivalent to 0.0, 2.7, 10.8, 65.8, and 134.8 mg/kg/day fo 3.6, 14.6, 85.2, and 168.8 mg/kg/day for females) for two years. All rats were observed daily for clinical signs of toxicity and morbidity, weighed w consumption monitored biweekly. Blood and urine samples were collected after 6, 12, and 18 months of treatment and at study end. Surviving ra sacrificed after 104 weeks of treatment. All rats were necropsied and the tissues and organs inspected grossly and microscopically for toxicity-re the carcinogenic potential of Imazalil.

Male and female rats in the 1200 ppm and 2400 ppm groups had slightly increased RBCs and slightly decreased MCVs and MCHs that reached significance at most measurement intervals. The differences, however, were within 6% of controls and the historical control limits for rats of this a species. No significant treatment-related effects of biological relevance were found for most clinical chemistry parameters. However, plasma trig activities of ALKP, AST, and ALT of male rats in the 2400 ppm group and female rats in the 1200 and 2400 ppm groups were often statistically de remained within historical control limits. The effects were considered related to malnutrition.

The effect of treatment on the liver (males and females) and thyroid (males only) were confirmed microscopically, but had distinct sex-related etio incidence of clear cell and basophilic foci was equivocal while eosinophilic foci were significantly increased for male rats in the 2400 ppm group. the 2400 ppm group, the incidences of clear cell and basophilic foci were significantly decreased but the incidence of eosinophilic foci was unaffe incidence of hepatocyte fatty vacuolation was increased only in male rats of the 1200 ppm and 2400 ppm groups while the incidence of pigmenta increased only in females of the 200, 1200, and 2400 ppm groups. In addition, the location of hepatocellular hypertrophy was distinctly different. the 1200 and 2400 ppm groups had significant increases in centriacinar and periacinar hypertrophy while male rats only had centriacinar hypertro the incidence of thyroid follicular cell hyperplasia was increased only in male rats of the 1200 and 2400 ppm groups.

The lowest observed adverse effect level (LOAEL) for male and female rats was 1200 ppm (65.8 and 85.2 mg/kg/day, respectively) with a corresponding no observed adverse effect level (NOAEL) of 200 ppm (10.8 mg/kg/day males, 14.6 mg/kg/day females). These are based found on body weight, weight gain, and the macro- and microscopic effects noted in the liver of all rats and the thyroid of male rats.

Male rats had a significant increase in the incidence of hepatocellular adenomas and thyroid follicular neoplasia while no increase was found for f These results indicate a difference in the disposition of Imazalil between the sexes increases hepatic and thyroid neoplasia in male rats, likely thr in metabolic activation of the test material.

EXPRESSION ANALYSIS

Gene Expression Profiling by Microarray and PCR

Human BeadChips assay up to 48,000 transcripts.
Mouse BeadChips assay up to 47,000 transcripts.
RatRef BeadChips assay up to 22,000 transcripts.
Customized chips- up to 1400 genes in 96well format.
Individual or multiplexed PCR (≤ 48 transcripts in parallel).

Toxicogenomic Profiling of Hepatocyte – Kupffer Cell Co-Cultures

- Testing human, mouse and rat
- Coordinating with Virtual Liver project
- Optimized ratio of Hepatocyte – Kupffer cells
- Concentration response
- Focusing analysis on Nuclear Receptor mediated gene expression pathways

  - NTP
- Genomics
  - MAQC Project

- EPA STAR Bioinformatics Centers
  - NJ (UMDNJ / Princeton)
  - University of North Carolina

Summary – ToxCast and ACToR

- Address the toxicity data gap for environmental chemicals
- Address the need for screening and prioritization
- Provide large, high quality *in vivo* and *in vitro* data collections for others to use
- Provide a vehicle for collaborative efforts in analyzing and predicting chemical toxicity
- All data will become public in 2008

The ToxCast Team
