

Incorporating 'omics in the study of reproduction and development:

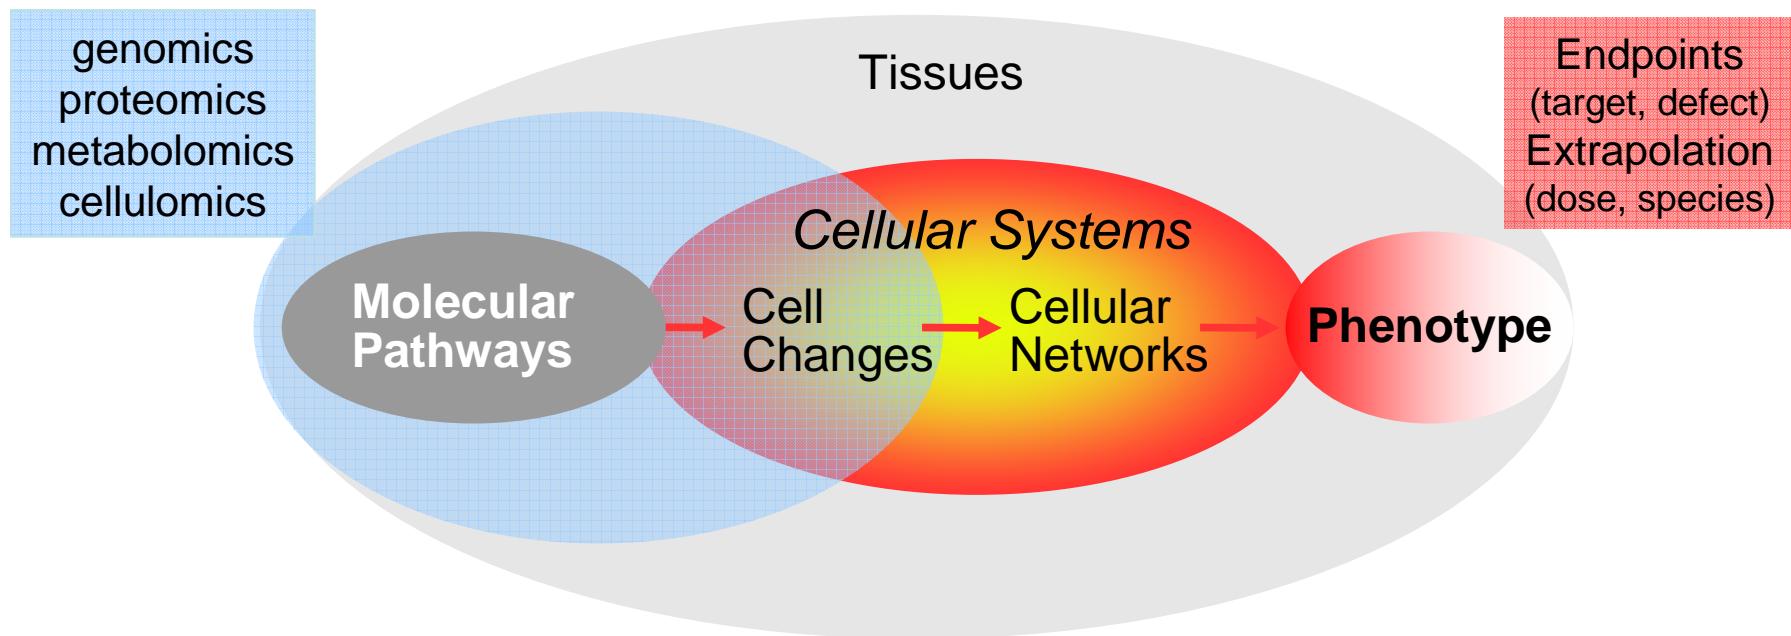

Virtual Tissue Models in Developmental Toxicity Research

TB Knudsen, I Shah, MR Rountree, AV Singh* & RJ Kavlock
National Center for Computational Toxicology & *Lockheed Martin

Disclaimer: views are those of the presenter and do not necessarily reflect Agency policy nor imply endorsement of software used here

Toxicity: a *cross-scale* phenomenon

PARADIGM: cell changes are causally linked to perturbation of molecular pathways; tissue lesions are then propagated by dynamic cellular networks

CHALLENGE: computational models that integrate detailed information captured at different biological scales to predict key events leading to adverse outcomes

Profiling Developmental Activity

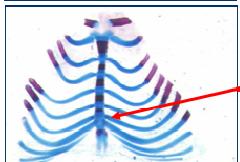

Toxicity Reference Database (ToxRefDB)

ToxRefDB holds source data captured from comprehensive *in vivo* studies
www.epa.gov/ncct/toxrefdb

images from www.DevTox.org

target: kidney
description: absent renal papilla
code: UG_REN_3.1060.5013

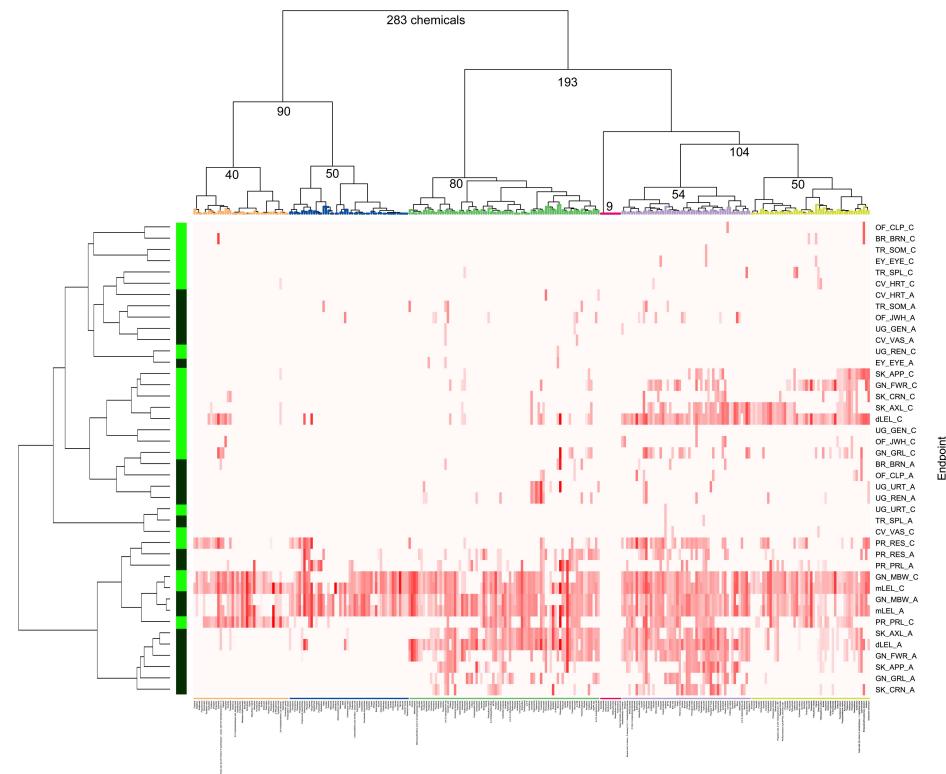

target: sternebra
description: incomplete ossification
code: SK_AXL_2.1099.5130

target: hindpaw
description: polydactyly (digit I)
code: SK_APP_2.1051.5234

387 chemicals, 988 annotated effects
www.DevTox.org, 751 prenatal studies

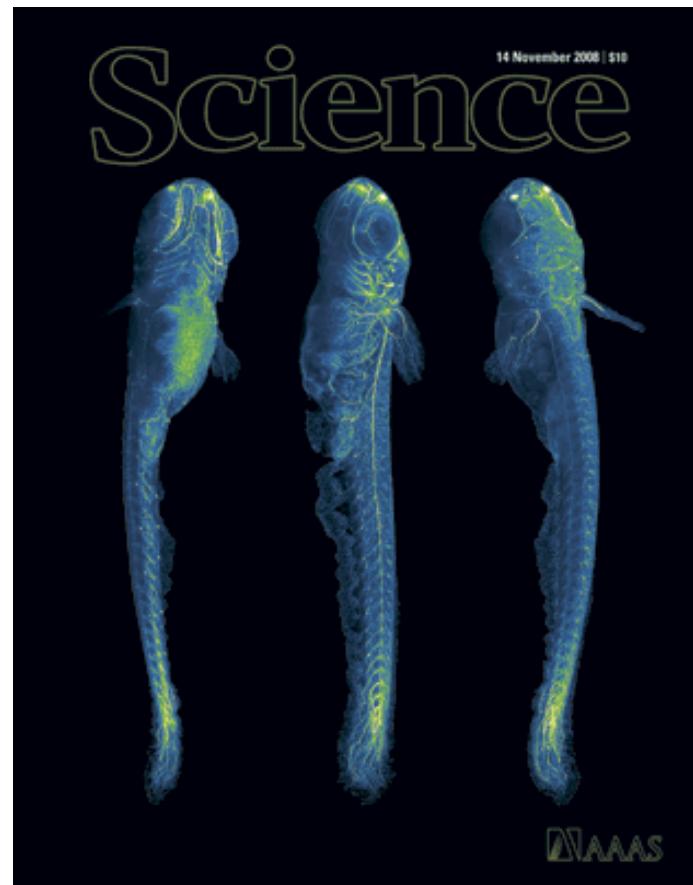

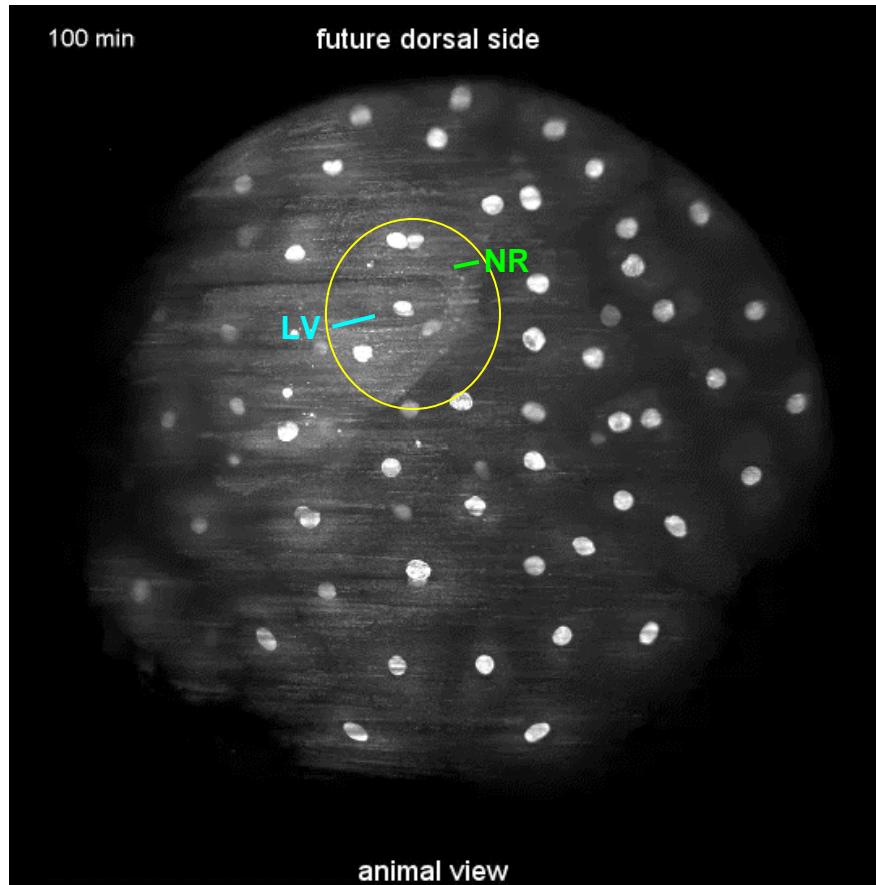

283 chemicals x 293 effects → 19 endpoint targets culled from rat and rabbit studies

Challenge: understanding the embryo as a complex dynamic system

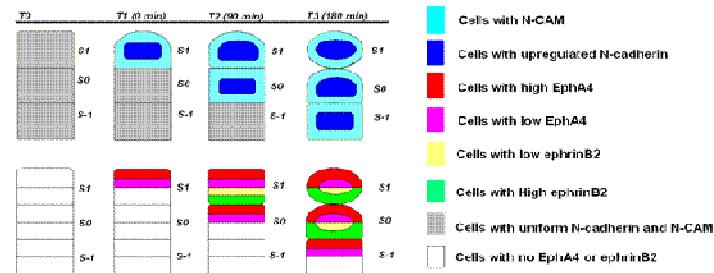

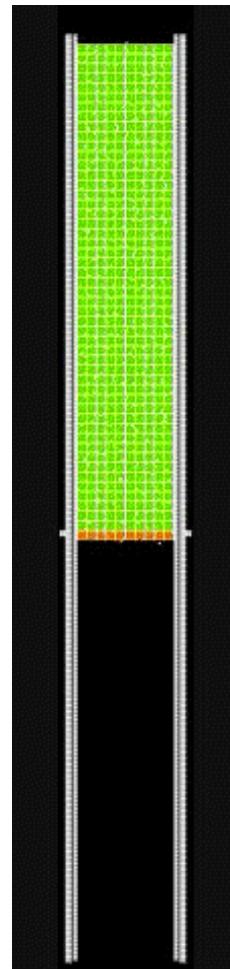

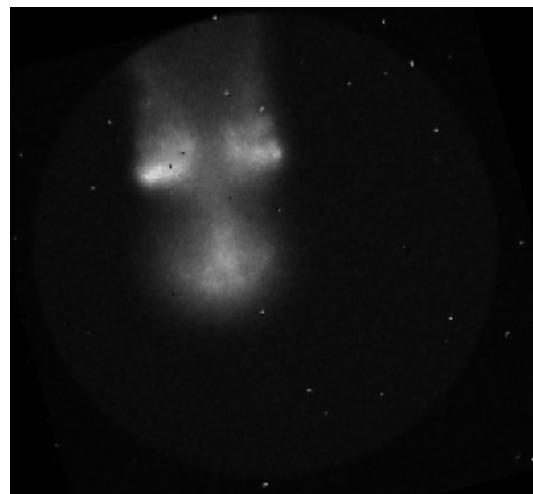

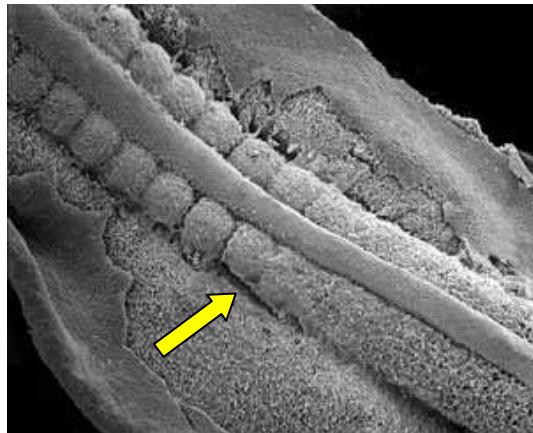

- **Input:** ToxCast™ chemical library reveals a complex linkage between molecular target and fetal endpoint
 1. which signaling networks and morphogenetic processes characterize sensitive systems at susceptible stages?
 2. what computational tools can we use to navigate the complexity of state changes in a dynamical system?
 3. can computational models be built to predict dysmorphogenesis across chemical class, dose, species, stage, and genetic makeup?
- **Output:** modular reconstruction of a developing tissue using computer models that execute rules in morphogenesis

Digital embryo: ZFET morphogenesis

Reconstruction of zebrafish early embryonic development
tracking H2B-EGFP by DSLM at 90s intervals over 18h

Cell-based models (CC3D): vertebrate segmentation clock

In silico model, CompuCell3D software

Morphogenesis toolbox

Core developmental processes

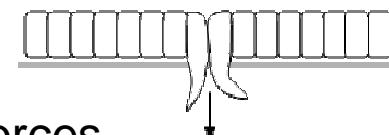

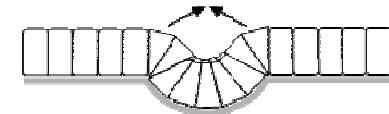

- patterning (sets up future events)
- timing (clocks and oscillators)
- differentiation (cell diversification)
- morphogenesis (tissue organization)

Cellular primitives

- growth (proliferation)
- death (apoptosis)
- differentiation (function)
- adhesion (DAH)
- shape (geometry)
- motility (cell migration)
- ECM (remodeling)

Morphogenetic movement

- folding
- epiboly
- convergent extension
- branching morphogenesis
- cell condensation
- cell sorting
- trans-differentiation
- cavitation
- involution
- tractional forces

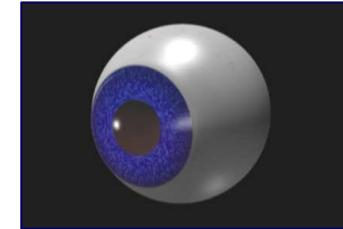

Directed cell movement

- contact guidance (boundaries)
- haptotaxis (ECM tracks)
- chemotaxis (chemical signals)

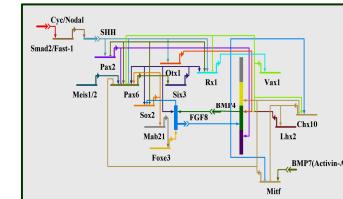

EPA's Virtual Embryo

1 abstraction: represent the morphogenetic blueprint of the target system

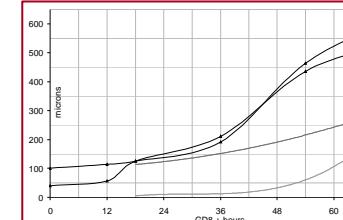

2 system wiring: build signaling networks for core developmental processes

3 cell-based rules: computer program (CC3D) implementing cellular primitives

```
#> model <model>

4 computational model: execute developmental trajectories *in silico*

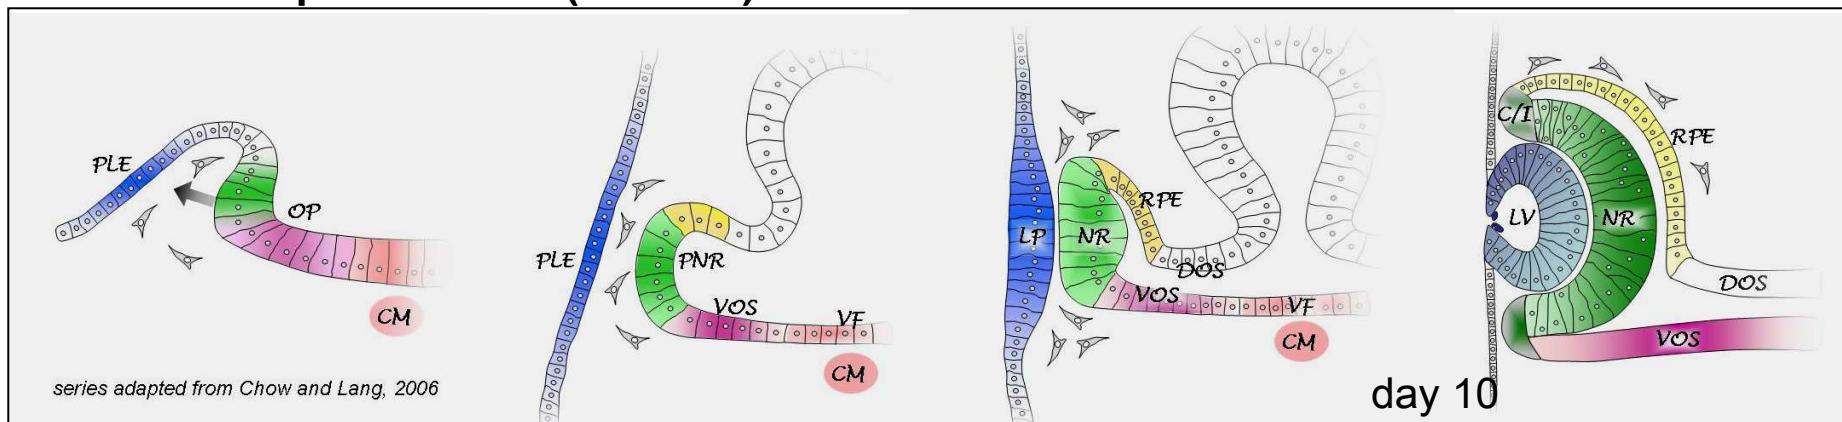

Early eye development

~days 8-11 mouse = ~20-37 days human gestation

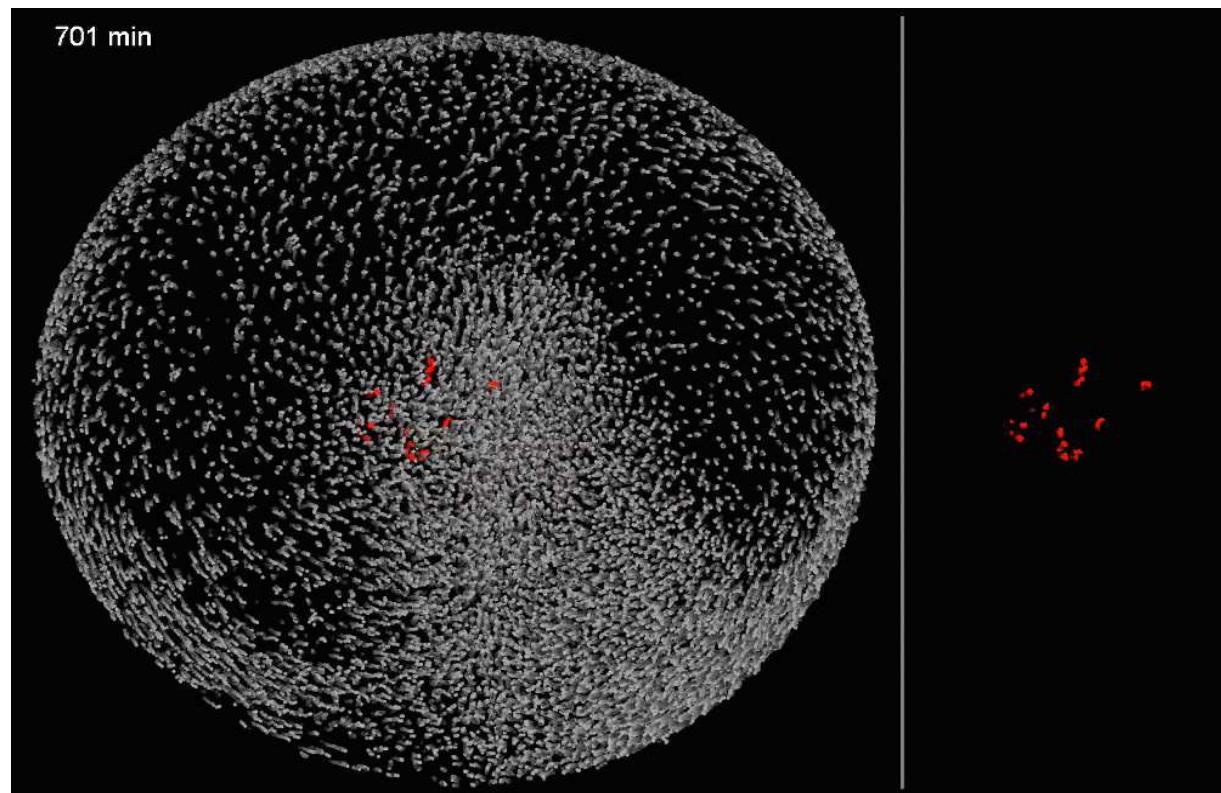

SEM series K Sulik, http://www.med.unc.edu/embryo_images/unit-eye/eye_htms/eyetoc.htm

Anatomical representation (TS12-18)

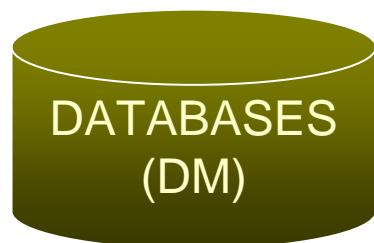

A real morphogenetic blueprint

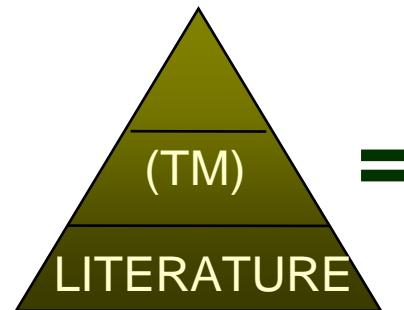

reverse-engineering the cellular dynamics of optic vesicle formation in the zebrafish embryo using DSLM

Building a signaling network

+

=

- summarization
- classification
- clustering
- ontologies
- concepts
- correlations
- causality

- structured
- computable
- easier to curate
- QA/QC
- semantics/metadata
- accurate but laborious

- unstructured
- algorithms needed to put in computable form
- difficult to manage and control
- noisy (filtering becomes essential)
- ambiguous - *cricket the game or cricket the bug?*
- coarse but fast

Literature-mining: establishing relevant gene-gene and gene-phenotype associations

E3078	A	B	C	PURPOSE.	The PAX6 gene was first described as a candidate for human aniridia. However, PAX6 expression is not restricted to the eye and it appears to be crucial for brain development. We studied PAX6 mutations in a large spectrum of patients who presented with aniridia phenotypes, Peters+ anomaly, and anterior segment malformations associated or not with neurological anomalies. METHODS: Patients and related families were ophthalmically phenotyped, and in some cases neurologically and endocrinologically examined. We screened the PAX6 gene by direct sequencing in three groups of patients: those affected individuals, their unaffected relatives, and with diverse eye manifestations, including those with Peters+ anomaly. The mutations were categorized according to the nature of the change: missense, frameshift, stop codon, and splice. RESULTS: Two novel mutations were identified in two families affected with Peters+ anomaly. A missense mutation, located in exon 5, and corresponding to the Leucine 64 Proline amino-acid mutation (L64P), the p.E56A>p.G nucleotide change, located in exon 6, and corresponding to the Serine 74 Tyrosine amino-acid mutation (S74C), and the nucleotide deletion (V48fsX53). The L64P mutation was identified in affected patients presenting bilateral microphthalmia, cataracts, and nystagmus. The S74C mutation was found in a large family that had congenital ocular abnormalities, diverse neurological manifestations, and variable cognitive impairments. The V48fsX53 deletion caused in the affected members of the same family apparently isolated patient affected by a complex ocular phenotype, characterized primarily by a bilateral microphthalmia. Whether this nucleotide change is indeed pathogenic remains to be demonstrated. Two previously known heterozygous mutations of the PAX6 gene sequence were also detected in patients affected by aniridia: a de novo previously known nucleotide change, g.972C>G, and a missense mutation, p.T100M. CONCLUSIONS: We identified three mutations associated with aniridia phenotypes (L64P, S74C, and V48fsX53). Three other mutations reported here cause non-aniridia ocular phenotypes associated in some cases with neurological anomalies. The IVS2+9G>A nucleotide change was detected in a patient with a microphthalmia phenotype. The L64P mutation was detected in a family with a microphthalmia phenotype. The S74C mutation was detected in a patient with a microphthalmia phenotype. The L64P mutation show that this mutation may affect the helix-turn-helix motif, and as a consequence the DNA-binding properties of the resulting mutated protein. Ser74 is located in the PAX6 PD linker region, essential for DNA recognition and DNA binding, and the side chain of the Ser74 contributes to DNA recognition by the linker domain through direct contacts. Crystallographic representations show that the S74C mutation results in a side chain and therefore perturbs the DNA-binding properties of PAX6. This study highlights the severity and diversity of the consequences of PAX6 mutations that appeared to result from the complexity of the PAX6 gene structure, and the numerous possibilities for DNA binding. This study emphasizes that neurodevelopmental abnormalities may be caused by PAX6 mutations. The neurodevelopmental abnormalities caused by PAX6 mutations are probably still overlooked in the current clinical examinations performed throughout the world in patients affected with aniridia.

Summary

- ❖ **Motivation:** scientific needs to understand mechanisms of toxicity and predict developmental defects from complex datasets
- ❖ **Research goal:** simulate as embryonic tissues react to perturbation across chemical class, system, stage, genetic makeup, dose and time
- ❖ **Data needs:** detailed knowledge of molecular embryology, cell signaling pathways, and cellular phenotypes
- ❖ **Output models:** modular reconstruction of a developing embryo from cell-based models of morphogenesis and differentiation
