## ECOSYSTEMS SERVICES RESEARCH PROGRAM

BUILDING A SCIENTIFIC FOUNDATION FOR SOUND ENVIRONMENTAL DECISIONS

*Previous work has demonstrated that the historical DLVO theory of aqueous colloidal particle stability may be useful in assessing the potential stability (and migration) of engineered nanomaterial colloidal suspensions in aquatic media.*

[www.epa.gov/ecology](http://www.epa.gov/ecology)

## ECOSYSTEMS SERVICES RESEARCH PROGRAM

BUILDING A SCIENTIFIC FOUNDATION FOR SOUND ENVIRONMENTAL DECISIONS

*Previous work has demonstrated that the historical DLVO theory of aqueous colloidal particle stability may be useful in assessing the potential stability (and migration) of engineered nanomaterial colloidal suspensions in aquatic media.*

*DLVO theory assumes that particles in aqueous suspension experience two energies: 1) electrostatic repulsive energies and 2) attractive, dipole interaction energies.*

***Previous work has demonstrated that the historical DLVO theory of aqueous colloidal particle stability may be useful in assessing the potential stability (and migration) of engineered nanomaterial colloidal suspensions in aquatic media.***

***DLVO theory assumes that particles in aqueous suspension experience two energies: 1) electrostatic repulsive energies and 2) attractive, dipole interaction energies.***

***When the repulsive energies dominate, a relatively stable aqueous suspension is formed; when attractive energies dominate, a suspension aggregates and becomes immobilized.***

[www.epa.gov/ecology](http://www.epa.gov/ecology)

## ECOSYSTEMS SERVICES RESEARCH PROGRAM

BUILDING A SCIENTIFIC FOUNDATION FOR SOUND ENVIRONMENTAL DECISIONS

***The Critical Coagulation Concentration (CCC) is the minimum ionic strength (or dissolved salt content) needed to induce rapid aggregation of a colloidal suspension in water.***

[www.epa.gov/ecology](http://www.epa.gov/ecology)

## ECOSYSTEMS SERVICES RESEARCH PROGRAM

BUILDING A SCIENTIFIC FOUNDATION FOR SOUND ENVIRONMENTAL DECISIONS

*The Critical Coagulation Concentration (CCC) is the minimum ionic strength (or dissolved salt content) needed to induce rapid aggregation of a colloidal suspension in water.*

*DLVO theory yields procedures for estimating the Critical Coagulation Concentration (CCC).*

## ECOSYSTEMS SERVICES RESEARCH PROGRAM

BUILDING A SCIENTIFIC FOUNDATION FOR SOUND ENVIRONMENTAL DECISIONS

$$CCC = \frac{3.84 \times 10^{-39} \gamma^4}{A^2 z^6} \text{ mol dm}^{-3}$$

(Shaw, 1992)

$$CCC = \frac{8.74 \times 10^{-39} \gamma^4}{A^2 z^6} \text{ mol dm}^{-3}$$

(Ross and Morrison, 1988)

$$CCC = \frac{8.1 \times 10^{-39} \gamma^4}{A^2 z^6} \text{ mol dm}^{-3}$$

(Overbeek, 1952)

$$\gamma = \frac{\text{EXP}(ze\Psi/2kT) - 1}{\text{EXP}(ze\Psi/2kT) + 1}$$

$k$  = Boltzmann constant

$e$  = charge of the proton

$A$  = Hamaker constant

$\Psi$  = zeta potential

$T$  = absolute temperature

$z$  = counterion valence

***To calculate a minimum ionic strength needed to induce rapid aggregation of any colloidal suspension in water (CCC), one needs estimates of:***

- 1) The temperature and valence of the counterion in water***
- 2) The Hamaker constant (A)***
- 3) The zeta potential ( $\psi_\zeta$ )***

***$\psi_\zeta$  can be experimentally estimated from electrophoretic mobilities or can be assumed to equal or be less than the diffuse layer potential ( $\psi_d$ ) obtained from geochemical speciation models.***

***Due to the availability of data, colloidal amorphous iron oxide was selected as a test substrate.***

***- representative water chemistry data and Hamaker constants for iron oxides are available in the literature***

***- datasets can be generated for conducting MINTEQA2 geochemical speciation model predictions of diffuse layer potentials with both the MIT Diffuse Layer Model and the Triple Layer Model.***

# Conclusions

- 1) Major ions will play a role in the electrokinetic properties of MNs in natural waters; aquatic chemistry is a dominant variable...***
- 2) DLM predictions of  $\Psi_d$  likely overestimate  $\Psi_z$  and TLM predictions of  $\Psi_d$  likely underestimate  $\Psi_z$***
- 3) OM coatings will likely stabilize colloidal amorphous iron oxide suspensions***
- 4) Given the large number of assumptions required in the simulations, extensive experimental datasets will likely be required in order to validate model predictions.***
