List of cold- and warm-water preference taxa

This appendix contains the lists of taxa that were included in the cold- and warm-water preference trait groups in Utah, Maine and North Carolina. Lists have been sorted first by state, then by taxon. These lists were developed using thermal optima and tolerance values specific to each state and/or region, literature, case studies and best professional judgment (BPJ) from regional advisory groups. These lists are meant as a first step, not a final product. They should be further refined as more data become available. These lists have been developed for particular regions, but there is some overlap (e.g., some taxa occur on the cold-water list in more than one state). For more information, contact Jen Stamp ([Jen.Stamp@tetrtech.com](mailto:Jen.Stamp@tetrtech.com)).

Empirical - North Carolina (EPA 2010)	EPA GCRP State Biomonitoring Data Climate Change Pilot Project 2010: Freshwater Biological Traits Table for North Carolina. Maximum likelihood inferences were based on a subset of the North Carolina biomonitoring database comprised of standard qualitative/full-scale collection method samples only. Maximum likelihood calculations were used instead of weighted average inference because abundance data in the North Carolina biomonitoring database are categorical (1=rare (1-2 specimens), 3=common (3-9 species) and 10=abundant (10 or more species). Calculations were based on instantaneous water temperature measurements and occurrences of organisms using the guidelines described by Yuan (2006). Empirical - Maine (EPA 2010)	EPA GCRP State Biomonitoring Data Climate Change Pilot Project 2010: Freshwater Biological Traits Table for Maine. Weighted average inferences are based on a subset of the Maine biomonitoring data. Average July, August, and September temperature values from 616 sites were used in this analysis. Calculations were based on instantaneous water temperature measurements and occurrences of organisms using the guidelines described by Yuan (2006).
