Abstract

Fine particulate matter (PM) of aerodynamic diameter 2.5 μm or less ($\text{PM}_{2.5}$) has been implicated in adverse health effects, and a National Ambient Air Quality Standard for $\text{PM}_{2.5}$ has been promulgated (July 1977) by the U.S. Environmental Protection Agency. A national network of ambient monitoring stations has been established to assist States in determining areas which do not meet the ambient standard for $\text{PM}_{2.5}$. For such areas, it is important to determine the major sources of the $\text{PM}_{2.5}$ so States can devise and institute a control strategy to attain the ambient concentrations set by the standard.

One of the tools often used by States in apportioning ambient $\text{PM}_{2.5}$ to the sources is a source-receptor model. Such a model requires a knowledge of the $\text{PM}_{2.5}$ chemical composition emitted from each of the major sources contributing to the ambient $\text{PM}_{2.5}$ as well as the chemical composition of the $\text{PM}_{2.5}$ collected at the receptor (ambient monitoring) sites. This report provides such a profile for a smelt tank at a pulp and paper facility. Along with the $\text{PM}_{2.5}$ emission profile, data are also provided for gas-phase emissions of several organic compounds. Data are provided in a format suitable to be included in the EPA source profile database, SPECIATE.

Foreword

The U.S. Environmental Protection Agency (EPA) is charged by Congress with protecting the Nation's land, air, and water resources. Under a mandate of national environmental laws, the Agency strives to formulate and implement actions leading to a compatible balance between human activities and the ability of natural systems to support and nurture life. To meet this mandate, EPA's research program is providing data and technical support for solving environmental problems today and building a science knowledge base necessary to manage our ecological resources wisely, understand how pollutants affect our health, and prevent or reduce environmental risks in the future.

The National Risk Management Research Laboratory (NRMRL) is the Agency's center for investigation of technological and management approaches for preventing and reducing risks from pollution that threaten human health and the environment. The focus of the Laboratory's research program is on methods and their cost-effectiveness for prevention and control of pollution to air, land, water, and subsurface resources; protection of water quality in public water systems; remediation of contaminated sites, sediments and ground water; prevention and control of indoor air pollution; and restoration of ecosystems. NRMRL collaborates with both public and private sector partners to foster technologies that reduce the cost of compliance and to anticipate emerging problems. NRMRL's research provides solutions to environmental problems by: developing and promoting technologies that protect and improve the environment; advancing scientific and engineering information to support regulatory and policy decisions; and providing the technical support and information transfer to ensure implementation of environmental regulations and strategies at the national, state, and community levels.

This publication has been produced as part of the Laboratory's strategic long-term research plan. It is published and made available by EPA's Office of Research and Development to assist the user community and to link researchers with their clients.

Lawrence W. Reiter, Acting Director.
National Risk Management Research Laboratory

EPA Review Notice

This report has been peer and administratively reviewed by the U.S. Environmental Protection Agency and approved for publication. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

This document is available to the public through the National Technical Information Service, Springfield, Virginia 22161.

Acknowledgments

Dave-Paul Dayton, Mark Owens, and Robert Martz of Eastern Research Group, Inc. (ERG) were responsible for conducting sampling at the test site and for preparing collected samples for transport to the analytical laboratories. Amy Frame, Donna Tedder, and Randy Bower of ERG were responsible for the carbonyl and volatile organic compound analyses. Joan Bursey and Raymond Merrill of ERG provided calculations, data analysis, and sections of the report pertaining to the ERG work on this project. Wendy Morgan of ERG prepared the typewritten manuscript.

Michael Hays, Kara Linna, and Jimmy Pau of the EPA, NRMRL-RTP, were responsible for the analysis of organic compounds, elements, and ionic species. Yuanji Dong, John Lee, David Proffitt, and Tomasz Balicki of ARCADIS, Geraghty & Miller, Inc., provided technical support in preparing the dilution sampling system and sampling substrates, in performing the elemental/organic carbon analyses, and in extracting organic compounds from the various sampling substrates. N. Dean Smith was the EPA Project Officer responsible for overall project performance.

C-18. Calculation of Individual Filter PM Emission Factors (12/16/01)		C-20

Table C-1. Calculation of Mass Emission Rates: Speciated NMOC (SNMOC), Smelt Tank Vent (12/14/01)

Quantity	Value	Units
Parameters Required		
Mass of analyte in total combustion air	0.16926	µg
Mass fuel consumed	1,016,465	kg
Average combustion air flow rate	20,008.9353	sft ³ /m
Run time	400	min
Average venturi flow rate	22.5	sL/min
Average dilution air flow rate	841.73	sL/min
Flow rate at sample collection unit	0.00975	L/min
Calculations		
Total volume of air sampled	266,636,007.8000	L
Volume of combustion air sampled	9000	L
Volume of dilution air	336,692	L
Dilution ratio	38.4102	
Mass flow rate of SNMOC in diluted sample	0.0434	µg/L
Mass flow rate of SNMOC in undiluted sample	1.6670	µg/L
Total mass of SNMOC in sampled air	15,003.0328	µg
SNMOC in total combustion air	377,803,051	µg
Mass emission rate of SNMOC	371.633	µg/kg
Mass emission rate of SNMOC	0.3717	mg/kg

Mass SNMOC Collected

Volume canister = flow rate into canister × test duration

Parameter	Value	Units	Volume	Units
Test duration	400.0	min		
Flow rate, dilution air canister	0.009750	L/min	3.9000	L
Flow rate, residence chamber canister	0.009750	L/min	3.9000	L

Mass SNMOC collected = SNMOC concentration × canister volume

Parameter	Value	Units	Mass	Units
SNMOC residence chamber	0.06751	µg/L	0.2633	µg
SNMOC dilution air	0.02411	µg/L	0.0940	µg
Mass SNMOC collected			0.1693	µg

Residence chamber 67.51 µg/m³

Dilution air 24.11 µg/m³

Note: Contaminants (*n*-hexane and acetone) deleted from data 12/14/01.

Table C-2. Calculation of Mass Emission Rates: Speciated NMOC (SNMOC), Smelt Tank Vent (12/15/01)

Quantity	Value	Units
Parameters Required		
Mass of analyte in total combustion air	0.281363	µg
Mass fuel consumed	916,019	kg
Average combustion air flow rate	20,008.9353	sft ³ /m
Run time	479.4	min
Average venturi flow rate	23.2	sL/min
Average dilution air flow rate	851.97	sL/min
Flow rate at sample collection unit	0.008136	L/min
Calculations		
Total volume of air sampled	271,623,255.4000	L
Volume of combustion air sampled	11,122.0800	L
Volume of dilution air	408,434.4180	L
Dilution ratio	37.7228	
Mass flow rate of SNMOC in diluted sample	0.0721	µg/L
Mass flow rate of SNMOC in undiluted sample	2.7212	µg/L
Total mass of SNMOC in sampled air	30,265.5429	µg
SNMOC in total combustion air	739,144,591.4000	µg
Mass emission rate of SNMOC	806.9101	µg/kg
Mass emission rate of SNMOC	0.8069	mg/kg

Mass SNMOC Collected

Volume canister = flow rate into canister × test duration

Parameter	Value	Units	Volume	Units
Test duration	479.38	min		
Flow rate, dilution air canister	0.008136	L/min	3.9002	L
Flow rate, residence chamber canister	0.008136	L/min	3.9002	L

Mass SNMOC collected = SNMOC concentration × canister volume

Parameter	Value	Units	Mass	Units
SNMOC residence chamber	0.10706	µg/L	0.4176	µg
SNMOC dilution air	0.03495	µg/L	0.1362	µg
Mass SNMOC collected				0.2814 µg

Residence chamber	107.06	µg/m ³
Dilution air	34.95	µg/m ³

Table C-3. Calculation of Mass Emission Rates: Speciated NMOC (SNMOC), Smelt Tank Vent (12/16/01)

Quantity	Value	Units
Parameters Required		
Mass of analyte in total combustion air	0.1509	µg
Mass fuel consumed	1,127,456	kg
Average combustion air flow rate	20,009	sft ³ /m
Run time	479.58	min
Average venturi flow rate	22.91	sL/min
Average dilution air flow rate	856.03	sL/min
Flow rate at sample collection unit	0.0090	L/min
Calculations		
Total volume of air sampled	271,725,241.6000	L
Volume of combustion air sampled	10,987.1778	L
Volume of dilution air	410,534.8674	L
Dilution ratio	38.3649	
Mass flow rate of SNMOC in diluted sample	0.0351	µg/L
Mass flow rate of SNMOC in undiluted sample	1.3464	µg/L
Total mass of SNMOC in sampled air	14,792.7778	µg
SNMOC in total combustion air	365,842,002.5000	µg
Mass emission rate of SNMOC	324.4845	µg/kg
Mass emission rate of SNMOC	0.3245	mg/kg

Mass SNMOC Collected

Volume canister = flow rate into canister × test duration

Parameter	Value	Units	Volume	Units
Test duration	479.58	min		
Flow rate, dilution air canister	0.009383	L/min	4.4999	L
Flow rate, residence chamber canister	0.008966	L/min	4.2999	L

Mass SNMOC collected = SNMOC concentration × canister volume

Parameter	Value	Units	Mass	Units
SNMOC residence chamber	0.05931	µg/L	0.2550	µg
SNMOC dilution air	0.02314	µg/L	0.1041	µg
Mass SNMOC collected			0.1509	µg

Residence chamber	59.31	µg/m ³
Dilution air	23.14	µg/m ³

Table C-4. Calculation of Mass Emission Rates: Total (Speciated + Unspeciated) NMOC, Smelt Tank Vent (12/14/01)

Quantity	Value	Units
Parameters Required		
Mass of analyte in total combustion air	0.40092	µg
Mass fuel consumed	1,016,465	kg
Average combustion air flow rate	20,008.9353	sft ³ /m
Run time	400.	min
Average venturi flow rate	22.5	sL/min
Average dilution air flow rate	841.73	sL/min
Flow rate at sample collection unit	0.0098	L/min
Calculations		
Total volume of air sampled	226,636,008	L
Volume of combustion air sampled	9000	L
Volume of dilution air	336,692	L
Dilution ratio	38.4102	
Mass flow rate of total NMOC in diluted sample	0.1028	µg/L
Mass flow rate of NMOC in undiluted sample	3.9486	µg/L
Total mass of total NMOC in sampled air	35,537.1376	µg
Total NMOC in total combustion air	894,888,333	µg
Mass emission rate of total NMOC	880.3927	µg/kg
Mass emission rate of total NMOC	0.8803927	mg/kg

Mass Total NMOC Collected

Volume canister = flow rate into canister × test duration

Parameter	Value	Units	Volume	Units
Test duration	400.	min		
Flow rate, dilution air canister	0.00975	L/min	3.9000	L
Flow rate, residence chamber canister	0.00975	L/min	3.9000	L

Mass Total NMOC collected = Total NMOC concentration × canister volume

Parameter	Value	Units	Mass	Units
Total NMOC residence chamber	0.13030	µg/L	0.5082	µg
Total NMOC dilution air	0.02750	µg/L	0.1073	µg
Mass Total NMOC collected			0.4009	µg

Residence chamber	130.30	µg/m ³
Dilution air	27.50	µg/m ³

Table C-5. Calculation of Mass Emission Rates: Total (Speciated + Unspeciated) NMOC, Smelt Tank Vent (12/15/01)

Quantity	Value	Units
Parameters Required		
Mass of analyte in total combustion air	0.496422	µg
Mass fuel consumed	916,019	kg
Average combustion air flow rate	20,008.935	sft ³ /m
Run time	479.4	min
Average venturi flow rate	23.2	sL/min
Average dilution air flow rate	851.97	sL/min
Flow rate at sample collection unit	0.0081	L/min
Calculations		
Total volume of air sampled	271,623,255	L
Volume of combustion air sampled	11,122.0800	L
Volume of dilution air	408,434.4200	L
Dilution ratio	37.7229	
Mass flow rate of total NMOC in diluted sample	0.1273	µg/L

^a RC = residence chamber; DA = dilution air.

^b When subtraction of the value of the Dilution Air from the Residence Chamber Air results in a negative number, the value "0" rather than the negative value is used for all subsequent calculations.

^c ND = not detected

^d When the value in Dilution Air is greater than that in the Residence Chamber Air, a negative number results from the subtraction. This negative number is treated as ND, or "0."

^e n-hexane deleted from 12/14/01 data as a contaminant from the denuders

^f Total NMOC with unknowns in $\mu\text{g}/\text{m}^3$ is an estimate based on propane only.

^a RC = residence chamber; DA = dilution air.

^b When subtraction of the value of the Dilution Air from the Residence Chamber Air results in a negative number, the value "0" rather than the negative value is used for all subsequent calculations.

^c ND = not detected

^d When the value in Dilution Air is greater than that in the Residence Chamber Air, a negative number results from the subtraction. This negatige number is treated as ND, or "0."

^e Total NMOC with unknowns in $\mu\text{g}/\text{m}^3$ is an estimate based on propane only.

^a RC = residence chamber = combustion air + dilution air

^b DA = dilution air

^c When the value in Dilution Air is greater than that in the Residence Chamber Air, a negative number results from the subtraction. This negative number is treated as ND, or "0."

^d *n*-hexane deleted from 12/14/01 data as a contaminant from the denuders

^e ND = not detected.

^f Total NMOC with unknowns in $\mu\text{g}/\text{m}^3$ is an estimate based on propane only.

^a RC = residence chamber = combustion air + dilution air

^b DA = dilution air

^c When the value in Dilution Air is greater than that in the Residence Chamber Air, a negative number results from the subtraction. This negative number is treated as ND, or "0."

^d ND = not detected.

^e Total NMOC with unknowns in $\mu\text{g}/\text{m}^3$ is an estimate based on propane only.

16. ABSTRACT <p>The report provides a profile of the chemical composition of particulate matter (PM) with aerodynamic diameter 2.5 µm or less (PM_{2.5}) emitted from a smelt tank at a pulp and paper facility using the Kraft pulping process. The first step in the Kraft process is to form pulp by digesting wood chips in an aqueous solution of sodium sulfide and sodium hydroxide at elevated temperature and pressure. This extracts the cellulose from the wood by dissolving the lignin that binds the cellulose fibers together. The pulp is washed, and the spent digestion liquor/wash water solution (black liquor) is separated from the cellulose (which forms the paper) and is sent through a process to recover the digestion chemicals. The black liquor undergoes a sequence of evaporation steps to yield a concentrated black liquor which is sent as fuel to a recovery boiler used to generate heat for process steam in the plant. Combusting the black liquor results in a molten smelt, which is composed primarily of inorganic chemicals, at the bottom of the recovery furnace. The smelt is collected, dissolved in water, and transferred to a tank where quicklime is added to regenerate the digestion reactants, sodium sulfide and sodium hydroxide. The data obtained during this research will assist States in determining the major sources of PM_{2.5} so they can devise and institute a control strategy to attain the ambient concentrations set by the National Ambient Air Quality Standard for PM_{2.5} that was promulgated in July 1977 by the U.S. EPA. Along with the PM_{2.5} emission profile, data are also provided for gas-phase emissions of several organic compounds. Data are provided in a format suitable to be included in the EPA source profile database, SPECIATE.</p>
