QA / QC : Flame Retardants in Dust

Flame retardant dust method detection limits and analytical spike recoveries are presented in Tables S1 and S2. For flame retardants in dust, three lab spikes were analyzed for recovery. The average lab spike recovery was 85.5% (SD=12.6). One dust sample was analyzed in duplicate for PBDE flame retardants and two dust samples were analyzed in duplicate for Firemaster 550 and tris phosphate ester flame retardants. The average relative standard deviation (RSD) for flame retardants analyzed in duplicates was 25.6% (SD=31.4).

Table S1. BDE Flame Retardant Recoveries and MDLs in Dust

	Mean Lab Matrix Spike Recovery (%)	MDL (ng/ml)	MDL (ng/g) ¹
BDE-47	80.8	4	6.9
BDE-99	83.9	4	6.9

TDCPP	107.3	1

QA / QC : Flame Retardants in Air

Flame retardant air sampling analytical spike recoveries and method detection limits are presented in Table S2. Two lab and field matrix spikes were analyzed for PBDE flame retardants in PUF by Battelle Laboratories. The average recovery for lab and field matrix spikes was 82.0% (SD= 9.2) and 86.2% (SD 16.9), respectively. Two indoor duplicates air samples were collected for BDEs, Firemaster 550 constituents and tris phosphate flame retardants. The average RSD was 42.1% (SD=41.7).

BDE 209 was an original target analyte for air analysis. However, after the first set of PUF analysis, the calibration curves and/or its C13-labelled analogue did not meet laboratory QA/QC standards. Therefore, only BDE 209 values for the first set of analysis are presented. For the non-BDE flame retardants in air, MDLs ranged from 0.2 to 0.5 ng for the non-BDE flame retardants. Using the average indoor air volume for SVOCs (1.9 m³), the MDL as a concentration for non-BDE flame retardants had a range of 0.1 to 0.3 ng/m³. BEHTBP was not detected in the spike analysis due to sensitivity problems in the EI GC/MS mode.

Table S3. Lab and Field Matrix Spike Recovery and Method Detection Limits for BDE Analytes in PUFs

Exposure factor calculation

The exposure factor (EF) is calculated:

Where,

F = frequency of exposure (days/year)

ED = exposure duration (years)

AT = averaging time (ED x 365 days/year)

Since children are not present in ECE facilities all hours of the day, we calculated the exposure factor (EF) based on the scenario that a child spends five days per week and 48 weeks per year (which accounts for four weeks away from day care for holidays and vacation). The averaging time will depend on how many years the child is in child care but is assumed to be one year in our calculations.

Table S10. Mean Child Body Weights Used for Dose Calculations

Age Group	Mean Body Weight (kg)
Birth to <1	6.75 ¹
1 to <2 Years	11.4
2 to <3 Years	13.8
3 to <6 Years	18.6

¹ Value based on average of three age groups (birth to <1 month, 2 to <6 months, and 6 to <12 months) from Arcus-Arth and Blaisdell, 2007.
