### Light-induced Litter Decomposition in Patagonian Steppe

**RESEARCH & DEVELOPMENT** 

Competing Effects of Solar Ultraviolet Radiation on Plant Litter Decomposition

- Enhances decomposition by direct photoreactions (open, arid ecosystems)
- Slows decomposition by inhibition of decomposers (e.g. fungi)
- Changes leaf composition in growing plants thus altering decomposition

RESEARCH & DEVELOPMENT

Developing Relationships Required to Model Sunlight-Induced Decomposition of Plant Litter

General Approach: Determine action spectra using Rundel technique (Rundel, *Physiol. Plant.*, 58, (1986) 360-366.) Steps:

- Determine decomposition rates by following certain indicators, e.g. weight loss, CO<sub>2</sub> or CO production using filters that block UV
- -Measure irradiance of filtered light
- -Fit the data using exponential (or other) equation of form (EXP (a + b \* Wavelength)
- -Use Excel Solver to compute values of a and b that minimize difference between observed and computed decomp rates

## Equation and Data Describing Litter Photodegradation Fluxes

$Flux = a exp^{-DA}$						
Species	а	b	RMSE	Sun Flux		
Kielmeyera coriacea	-2.37	-0.0198	0.00131	0.0028		
Qualea grandiflora	3.12	-0.0348	0.00165	0.0031		
Brachiaria sp.	8.63	-0.0507	0.00417	0.0034		
Sheflera macrocarpum	2.78	-0.0314	0.00484	0.0073		
Vochysia elliptica	7.55	-0.0448	0.00421	0.0085		
Vochysia thyrsoidea	-0.40	-0.0219	0.00677	0.0093

Estimated Relationship Between Degradation and Photosynthetically Active Radiation (PAR)

CO flux =  $7.5 \times 10^{-6} \times (PAR)$ 

 $CO_2$  flux = (7.5 -15) x 10<sup>-6</sup> x (PAR) (PAR expressed as W m<sup>-2</sup>)

For Cerrado CO<sub>2</sub> in dry season est. 0.3-0.6 µmol m<sup>-2</sup> s<sup>-1</sup> ~15-30% of observed

**RESEARCH & DEVELOPMENT** 

## Summary of Results and Conclusions

- Litter photodegradation is a significant CO source and loss pathway for surface litter in the Cerrado during dry season.
- Action spectra for litter photodegradation are species dependent and induced primarily by UV component of sunlight
- Fertilizer addition, esp. P, increases the microbial respiration of the labile C of surface SOM from Cerrado s.s. and enhances CO uptake
