SAFE AND SUSTAINABLE WATER RESOURCES RESEARCH PROGRAM

Analysis and Monitoring of Algal Toxins in Fresh and Coastal/Estuarine Environments

Heath Mash

US EPA Cincinnati OH

14th Annual EPA Drinking Water Workshop
August 22, 2017

U.S. Environmental Protection Agency, through its Office of Research and Development, funded and managed, or partially funded and collaborated in, the research described herein. It has been subjected to the Agency's peer and administrative review and has been approved for external publication. Any opinions expressed in this paper are those of the author(s) and do not necessarily reflect the views of the Agency, therefore, no official endorsement should be inferred. Any mention of trade names or commercial products does not constitute endorsement or recommendation for use.

Harmful Algal Blooms (HABs)

- ❖ HABs result in approximately \$2.2B of associated costs annually in the US, from restricted use of recreational waters, declining waterfront real estate value, spending on recovery of biodiversity, and drinking water treatment.
- ❖ Wide variety of taxa can produce blooms
- ❖ Typically detrimental to the aquatic system and can be harmful to humans and land animals (contact and consumption)
- ❖ Blooms are dependent on numerous factors, including nutrient loading, temperature, water flow and weather patterns

Microcystin and other Cyanotoxin Toxin Producers

Microcystis

Oscillatoria

Nostoc

Anabaenopsis

Aphanocapsa

Haplosiphon

Pseudanabaena

Synechocystis

Synechococcus

Largest population of cyanotoxin producers in the Great Lakes:

- ❖ *Microcystis aeruginosa*
- ❖ *Anabaena circinalis*
- ❖ *Anabaena flos-aquae*
- ❖ *Aphanizomenon flos-aquae*
- ❖ *Cylindrospermopsis raciborskii*

Source: NOAA

Speciation of toxin producers in Lake Erie nearest Toledo in:

2013:

- ❖ *Microcystis* sp. 80 99%
- ❖ Other microcystin producers 1 20%

2014:

- ❖ *Microcystis* sp. 85 95%
- ❖ Other microcystin Producers 2 15%
- ❖ Non microcystis producers 0 2%
- ❖ *Dolichospermum* 0 5%

Source Water Impacts on Drinking Water

Problems facing drinking water treatment:

- ❖ Excessive nitrogen and phosphorous levels can cause harmful algal blooms
 - ❖ Agriculture (non-point source) is often the largest contributor of nitrogen load into waterways
- ❖ Forecasting is difficult because algal/cyanobacteria strains bloom under different conditions at different times
- ❖ Additionally, an algal bloom may not necessarily produce toxins
 - ❖ Treatment is still impacted due to biofouling, taste and odor concerns, increasing disinfection by-product potential, etc.

Algal blooms put pressure on drinking water facilities, requiring:

- 
- Immediate operational changes (i.e. PAC addition) can be costly, with varying effectiveness
 - Possible shut-off of services, public relations challenges
 - Costly facility upgrades

Current Regulations/Guidance

Water Advisory

Water may contain blue-green algae that is harmful to humans and animals

Avoid thick green, white, or reddish-brown scum on the surface of the pond.

Avoid activities that can result in swallowing water that contains scum. This may affect your health.

Wash with clean water as soon as possible following contact with blue-green algae.

If you, your children or your animals become sick after contact, call your doctor or veterinarian.

For more information, see the water use decision dashboard.

21 states have recreational water guidelines for harmful algae blooms

Three states (MN, OH, and OR) have implemented standards or guidelines that apply to cyanotoxins in drinking water

EPA's Office of Water has released its Health Advisory Level for microcystin-LR and cylindrospermopsin

EPA's informational webpage

http://www2.epa.gov/nutrient_policy_data/cyanobacterial_harmful_algal_blooms_cyanohabs

Notice

An algae bloom has made this area potentially unsafe for water contact. Avoid direct contact with visible surface scum.

Current Regulations/Guidance

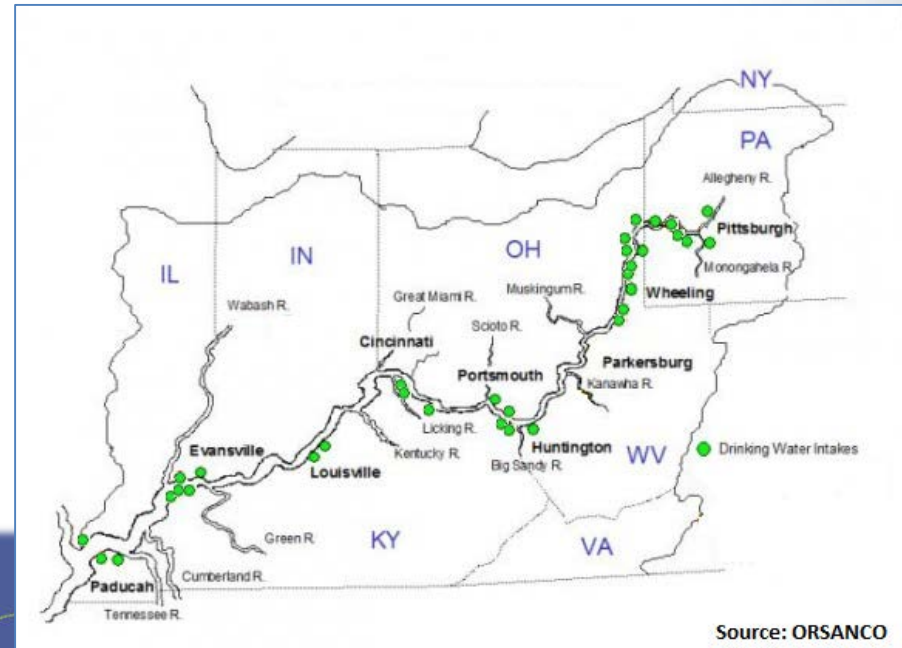

- State Health Advisory Levels (MYCs)
 - OH
 - "Do not Drink" Advisories
 - 0.3 µg/L Tot MYC Child < 6 yr & Sensitive Pop
 - 1.6 µg/L Tot MYC Child > 6 yr & Adults
 - MN 0.04 µg/L as MYC LR
 - OR 1.0 µg/L as MYC LR
 - "Do Not Use" Advisory
 - 20 µg/L
- USEPA Health Advisory Level for microcystin-LR and Cylindrospermopsin
 - "Drinking Water Health Advisory for the Cyanobacterial Microcystin Toxins"
 - "Drinking Water Health Advisory for the Cyanobacterial Toxin Cylindrospermopsin"
 - 0.3 µg/L MYC (0.7 µg/L CYL) 10 Day Infants/Young Children
 - 1.6 µg/L MYC (3.0 µg/L CYL) 10 Day Adults
- The Harmful Algal Bloom and Hypoxia Research and Control Amendments Act of 2014
 - Delegates primary responsibility to NOAA in advancing the scientific understanding and ability to detect, monitor, assess, and predict HAB and hypoxia events in marine and freshwater
- Safe Drinking Water Act
 - Contaminant Candidate List 4 (draft) includes cyanotoxins
 - Microcystin LR, Anatoxin a, Cylindrospermopsin
 - Unregulated Contaminant Monitoring Rule (2018 2020)
 - US EPA Method 544

Lake Erie and the Ohio River are Major Drinking Water Sources

29 Ohio and 2 Michigan communities intake water directly from Lake Erie (Western and Central Basins)

Subsequent communities purchase either treated or untreated water from these primary DWTPs and may subject the water to further treatment

Source: ORSANCO

The Ohio River is a major source of drinking water along its entire reach

Ohio In 2013 and 2014

❖ Celina (population 10,400)

Summer 2013: > 100 µg/L total microcystins and nodularin in treatment plant influent

❖ Carroll Township (population 2,000)

September 4, 2013 = 1.4 µg/L

September 5, 2013 = 3.6 µg/L

Switched to emergency connection with Ottawa County

Began flushing distribution system

Ohio EPA's first "Do Not Drink" advisory issued due to microcystin

On Advisory 48 Hours

❖ Toledo (population ~500,000)

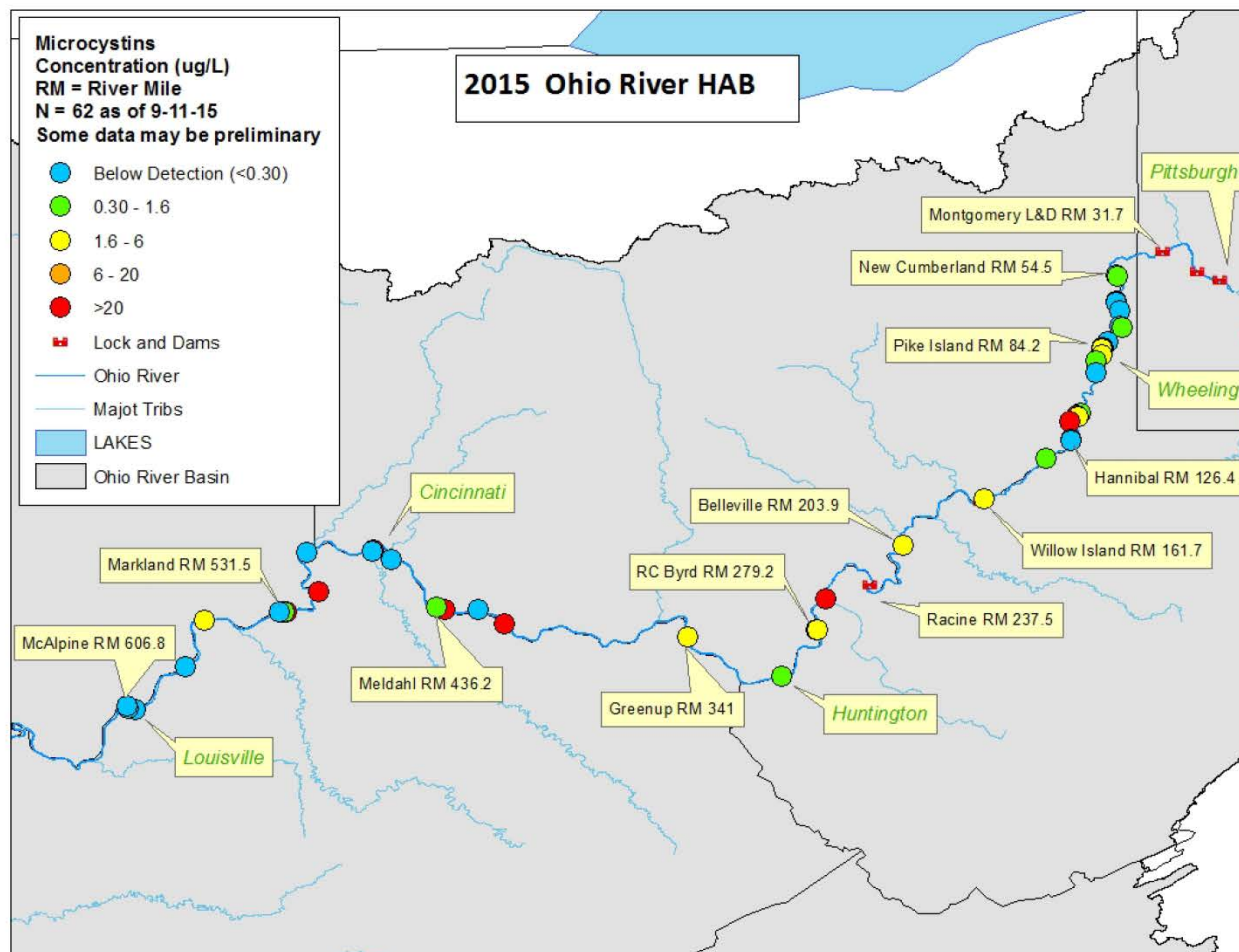

September 2013: Detectable, but < 1 µg/L toxin in finished water

August 2014: > 1 µg/L total microcystins and nodularin in finished water,

Ohio EPA "Do Not Drink" advisory

2015 Ohio River Bloom

- **Approximate Dates:**
August 19th through
October 29th, 2015
- **Main Contributor:**
Microcystis aeruginosa
- **3×10^7 cells/ml**
 *1×10^5 typically
referenced as level
for water impairment*
- **Numerous
recreational water
advisories**

Source: Ohio River Sanitation Commission

- ❖ MYCs are cyclic heptapeptides
- ❖ Varying strains produce different toxins at different rates and quantities
- ❖ Exist in multiple variants
 - 113+ known microcystin variants
 - Significant differences in hydrophobicity and pKa
 - Species can be multi-charged

All MYCs include the ADDA (3-amino-9-methoxy-2, 6, 8-trimethyl-10-phenyl-4(E), 6(E)-decadienoic acid, red) and methyldehydroalanine (MDHA, purple) modified amino acids. Leucine (green) and arginine (blue) residues are sites of structural diversity, referred to as positions X and Z, respectively.

Variants differ in potency

Estimated cytotoxic IC₅₀ values

| MC variants name | IC ₅₀ (µg/mL) |
|--|--------------------------|
| [D-Asp ³ , Z-Dhb ⁷] MC-LR | 0.053 |
| [D-Asp ³ , Z-Dhb ⁷] MC-HtyR | 0.120 |
| [D-Asp ³ , E-Dhb ⁷] MC-LR | 0.133 |
| [D-Asp ³ , Dha ⁷] MC-LR | 0.217 |
| [D-Asp ³] MC-LR | 0.217 |
| [Dha ⁷] MC-LR | 0.217 |
| [D-Asp ³ , E-Dhb ⁷] MC-HtyR | 0.327 |
| [D-Asp ³] MC-HtyR | 0.347 |
| [Dha ⁷] MC-YR | 0.418 |
| MC-LR | 0.800 |
| MC-YR | 1.48 |
| [D-Asp ³ , Dha ⁷] MC-RR | 4.11 |
| [D-Asp ³ , E-Dhb ⁷] MC-RR | 4.95 |
| [Dha ⁷] MC-RR | 5.33 |
| [D-Asp ³] MC-RR | >10 |
| MC-RR | >10 |

Shimizu, Kumiko, et al. *Toxins* 6.1 (2013): 168-179.

**Toxin within the cell and those that are dissolved
require different sample processing and treatment**

Particulates (toxin in cell)

- ❖ Solids removal processes effective
- ❖ Do not want to lyse cell or toxin will be released

Microcystis (cells)

Dissolved (toxin released from cell)

- ❖ Solids removal processes ineffective
- ❖ Typical disinfectants or dosages may not be effective (e.g., permanganate, chlorine)
- ❖ More effective treatments are expensive and plants typically do not have them in place (e.g., GAC)

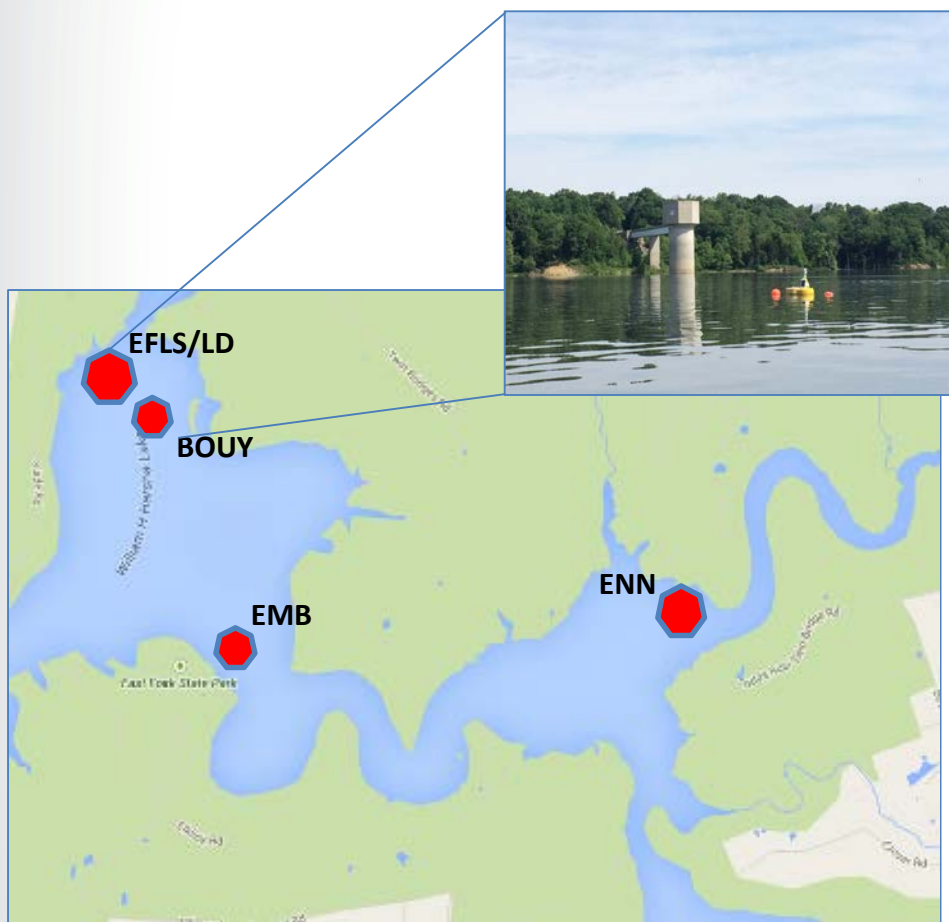

Microcystin Toxin

Lake Harsha Cyanobacteria Bloom Study

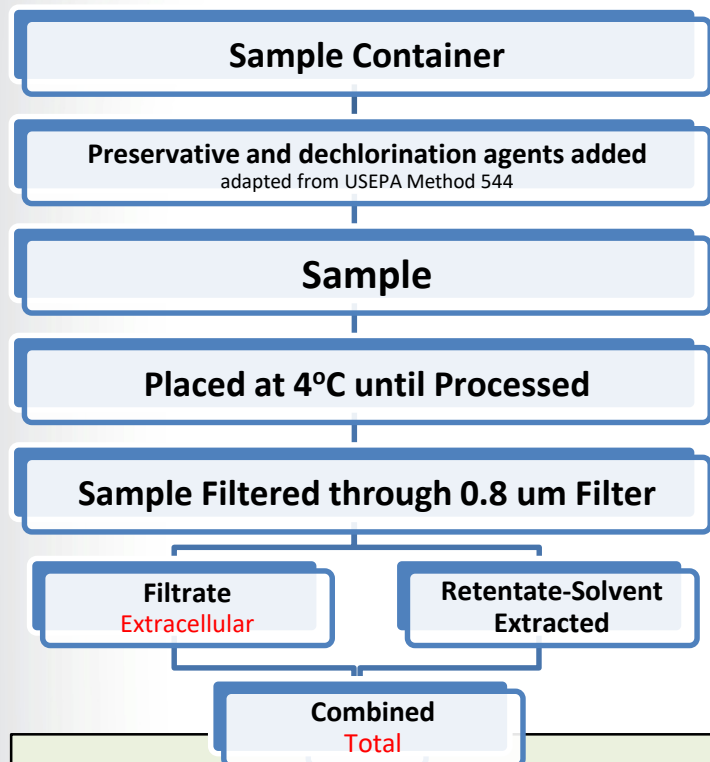

Study Site Lake Harsha (East Fork State Park)

- 5 Sites
 - Inlet (ENN)
 - Beach (EMB)
 - Buoy near drinking water intake (BOUY)
 - Drinking water intake – Surface (EFLS)
 - Drinking water intake – Intake at depth (EFLS)
- Weekly sampling March-November
- 3x/week during observed bloom
- Bi-hourly sampling for 4 hours on representative days

Sample Handling and Analytical Methods

Other Analysis

- Chlorophyll-a (USEPA 445.0)
- Phycocyanin
- Water Quality Parameters (i.e. Nutrients, Metals)

Enzyme Linked Immunosorbent Assay (ELISA)

- ❖ Broad-based method
 - Total toxin concentration congeners/variants
- ❖ Abraxis Microcystins/Nodularins (ADDA), ELISA Kit, Microtiter Plate

LC/MS

- Two LC/MS/MS methods
 - Triple quad and IT/HRMS (Orbitrap)
- Analytical methods includes 13 commercially-available MC congeners/variants
- Anatoxin A and Cylindrospermopsin (USEPA 545)
- MMPB Oxidation (Total MC methodology)
 - (2-methyl-3-methoxy-4-phenylbutyric acid)

Mass Spectrometry

| Algatoxin | Formula | M _{mi} of Measured Species [M+H] ⁺ (Da) |
|------------------------------------|---|--|
| Microcystin LF | C ₅₂ H ₇₁ N ₇ O ₁₂ | 986.523 |
| Microcystin LR | C ₄₉ H ₇₄ N ₁₀ O ₁₂ | 995.556 |
| Microcystin LW | C ₅₄ H ₇₂ N ₈ O ₁₂ | 1025.532 |
| Microcystin LY | C ₅₂ H ₇₁ N ₇ O ₁₃ | 1002.518 |
| Microcystin RR | C ₄₉ H ₇₅ N ₁₃ O ₁₂ | 519.792 ^c |
| Microcystin WR | C ₅₄ H ₇₃ N ₁₁ O ₁₂ | 1068.543 |
| Microcystin YR | C ₅₂ H ₇₂ N ₁₀ O ₁₃ | 1045.535 |
| Nodularin | C ₄₁ H ₆₀ N ₈ O ₁₀ | 825.450 |
| [D-Asp3-(E)-Hhb7] Microcystin-HphR | C ₅₂ H ₇₂ N ₁₀ O ₁₂ | 1029.540 |
| [D-Asp3-(E)-Dhb7] Microcystin-RR | C ₄₈ H ₇₃ N ₁₃ O ₁₂ | 512.786 ^c |
| Microcystin-N-Methyl-LR | C ₅₀ H ₇₆ N ₁₀ O ₁₂ | 1009.572 |
| Microcystin-HilR | C ₅₀ H ₇₆ N ₁₀ O ₁₂ | 1009.572 |
| Microcystin-HtyR | C ₅₃ H ₇₄ N ₁₀ O ₁₃ | 1059.551 |
| [D-Asp3] Microcystin-RR | C ₄₈ H ₇₃ N ₁₃ O ₁₂ | 1024.557 |
| [D-Asp3] Microcystin-LR | C ₄₈ H ₇₂ N ₁₀ O ₁₂ | 981.540 |

○ LC-IT/HRMS (Orbitrap)

- Dionex Ultimate 3000 UPLC
 - 3400RS Analytical Pump
 - 3400SD Loading Pump
 - Equan Autosampler
- Thermo Discovery Orbitrap
 - MS/MS product scan
 - Primary and confirmatory ions observed
 - Internal standards added to samples and standards
 - 8 point standard curve used (0.0 to 1000 ppt)
- Internal Standards
 - ¹³C,¹⁵N₂ 17-Amino Geldanamycin (225 ng/L)
 - Clarithromycin (56.25 ng/L)
 - ¹³C₆-Paclitaxel (562.5 ng/L)
 - Tacrolimus (56.25 ng/L)
 - Virustomycin A (1125 ng/L)
 - d₅-Atrazine (45 ng/L)

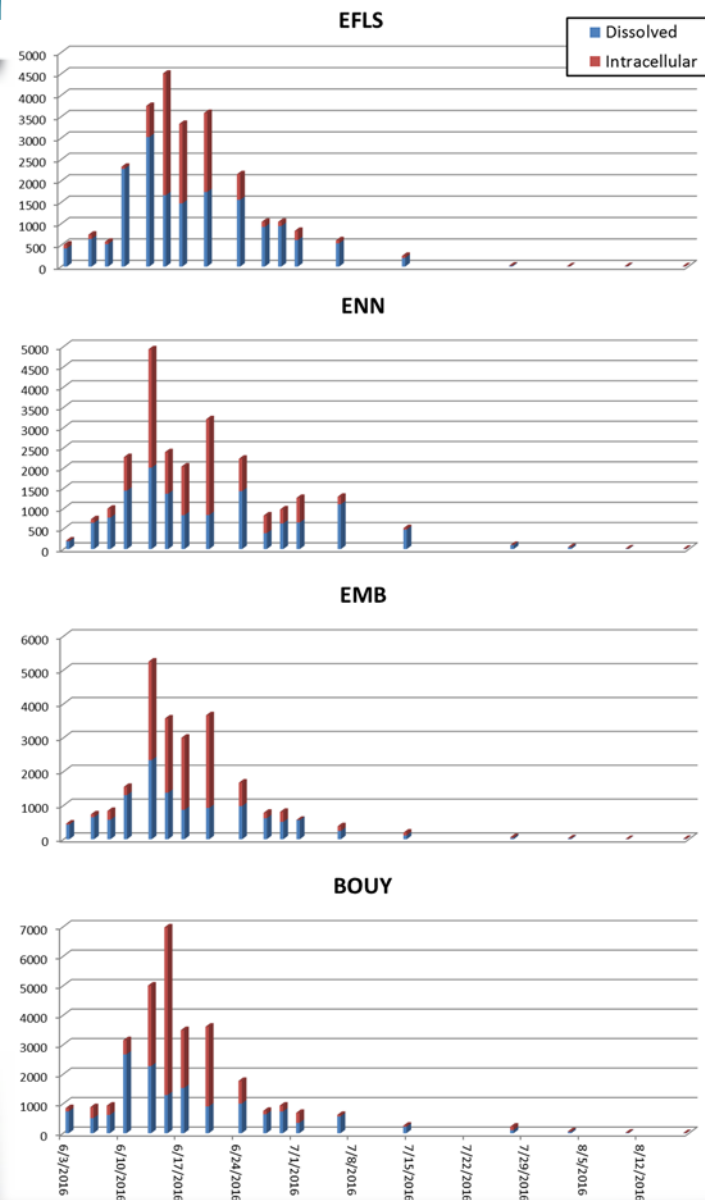

2016 Study Season – Total Targeted MC Concentration

Total Concentration of Known MYC Variants

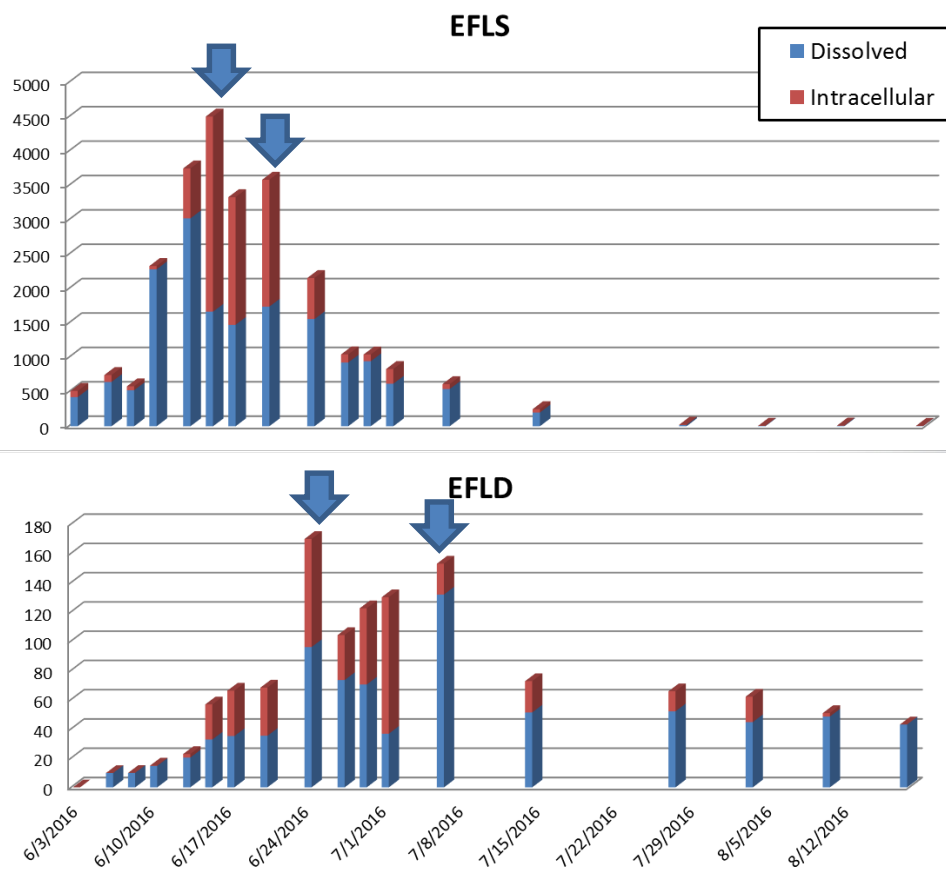

- Similar targeted MCs concentration pattern seen between EMB and ENN sites
- Similar pattern appeared between EFLS and BOUY sites

2016 Study Season – Total Targeted MC Concentration

Total Concentration of Known MYC Variants

- Delayed response in peak MC concentrations between the surface (EFLS) and depth sample (EFLD)

Satellite Imaging

Estimated Cell Counts

EFLD/EFLS = 1,023,293 cells/ml

BUOY = 676,083 cells/ml

EMB = 323,594 cells/ml

ENN = 1,258,925 cells/m

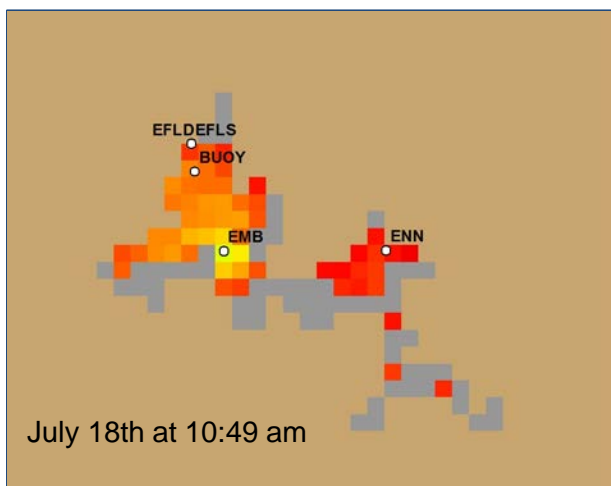

BOUY Site Fixed Camera Station

Fixed Camera Prediction of Cyanobacteria

- Camera Prediction:
- 10:30 am - 98.3% Probability of Bluegreens
- 11:30 am 100% Probability of Bluegreens

Satellite Imaging

Estimated Cell Counts

EFLD/EFLS = 1,023,293 cells/ml
 BUOY = 676,083 cells/ml
 EMB = 323,594 cells/ml
 ENN = 1,258,925 cells/m

Targeted LC/MS/MS MC Concentration

Total Targeted MC Concentration

EFLD/EFLS = 1244.3 ppt
 BUOY = 1179.7 ppt
 EMB = 1725.3 ppt
 ENN = 1843.8 ppt

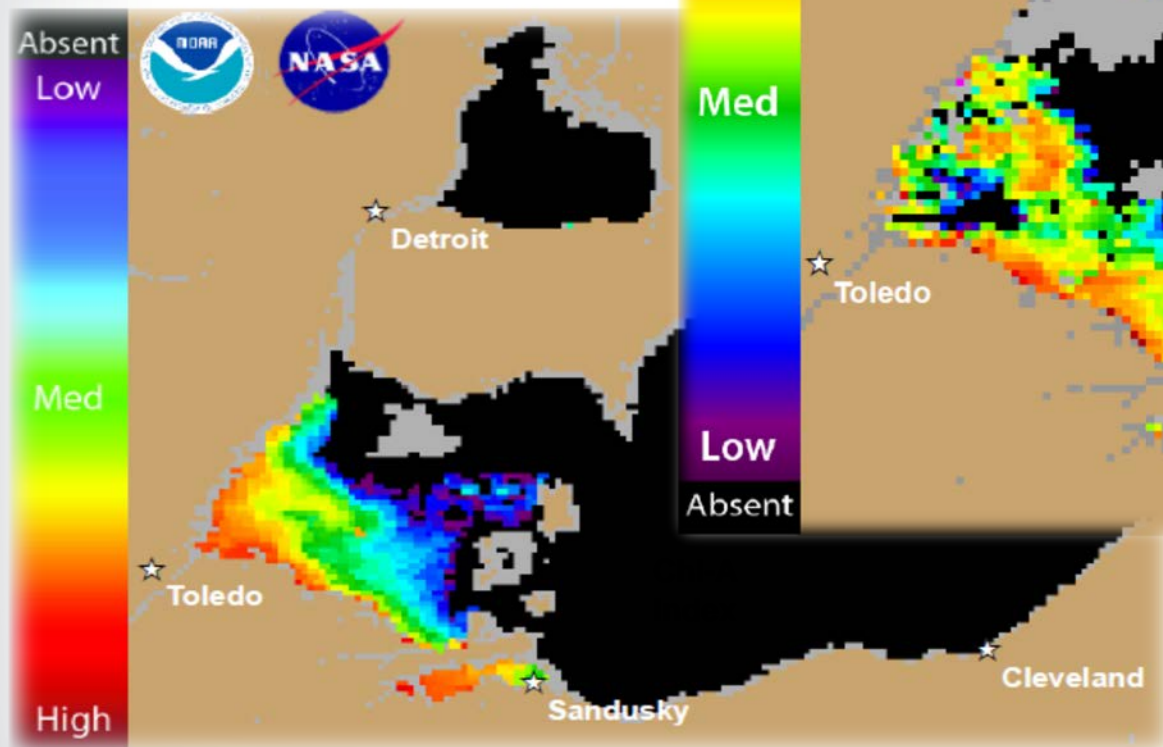

Lake Erie Drinking Water Treatment Plant Study

Lake Erie Blooms 2014 vs. 2015

- Toxic vs. Non-Toxic Producing Blooms

August 2014

Chl-a Index

Chl-a Index

High

Med

Low

Absent

Detroit

Toledo

Sandusky

Cleveland

August 2015

Source: NOAA/NASA

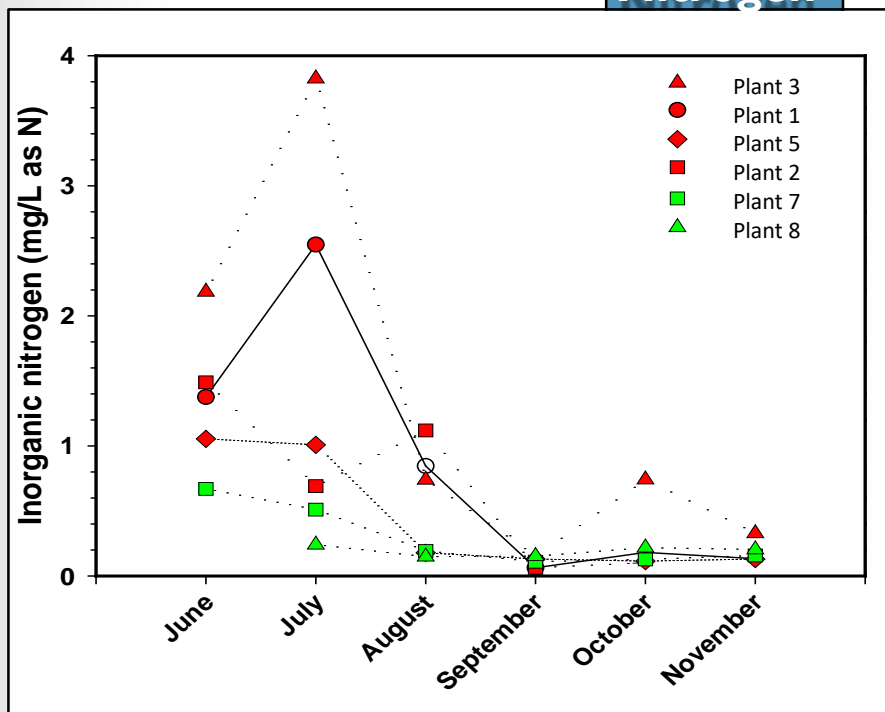

- ❖ Chlorophyll-a, a proxy indicator, concentrations peak in August-September, consistent with the observed HAB occurrence
- ❖ Large fluctuations show need for an increased sampling frequency

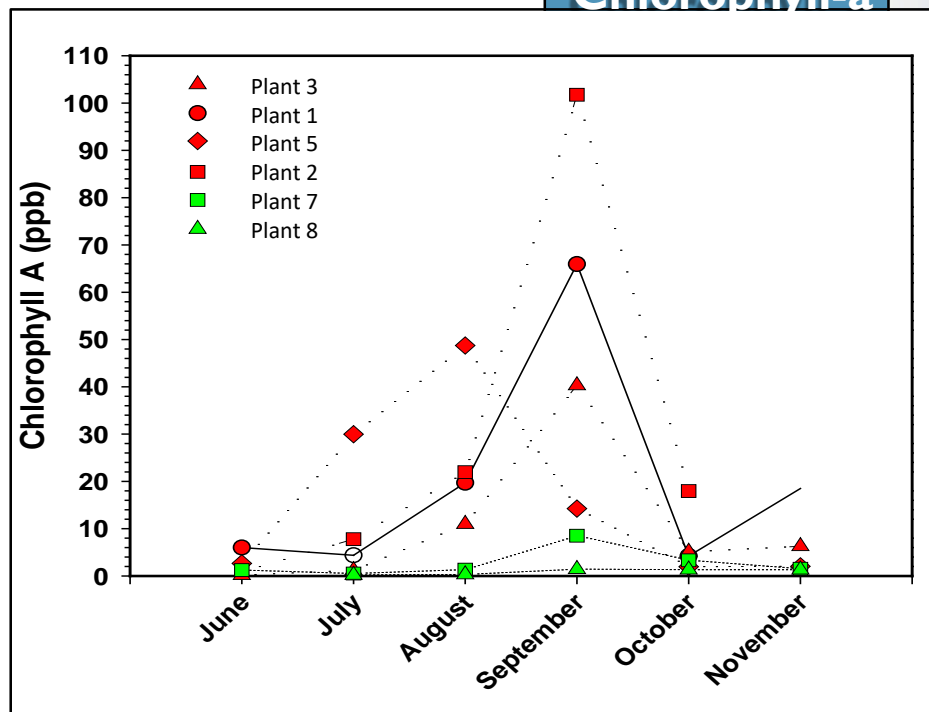

Nutrient and Bloom Event Flux 2014

Nitrogen

Western basin intakes had higher **nutrient** loadings in early summer

Chlorophyll-a

Western basin intakes had higher **blooms** levels later in summer

Seasonal Bloom Dynamics

**Plant 2
2013 vs. 2014**

Similar concentration was observed at the peak of the bloom for each year

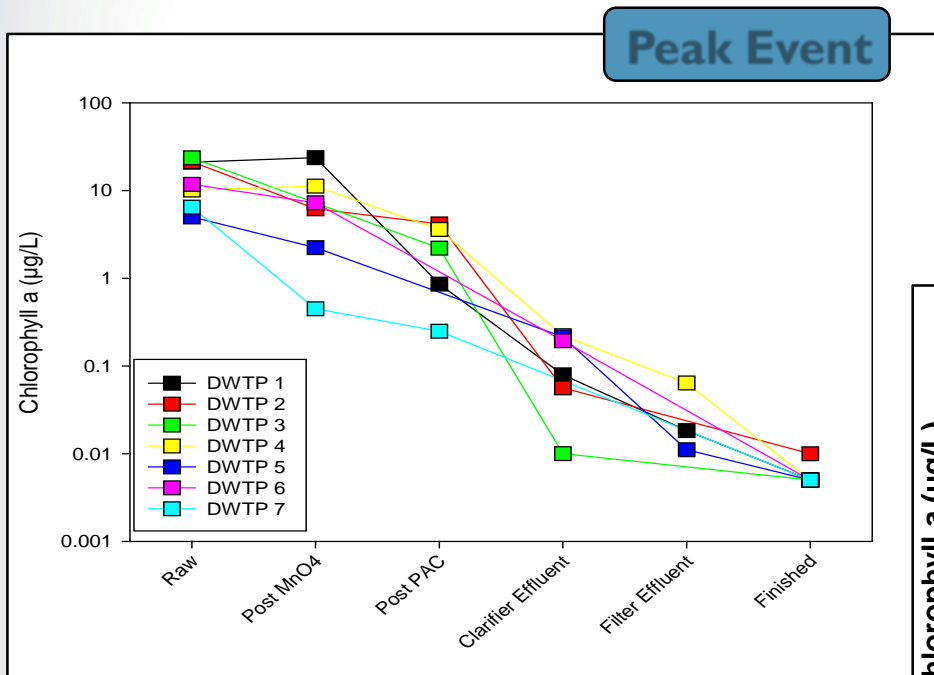

2014 Season

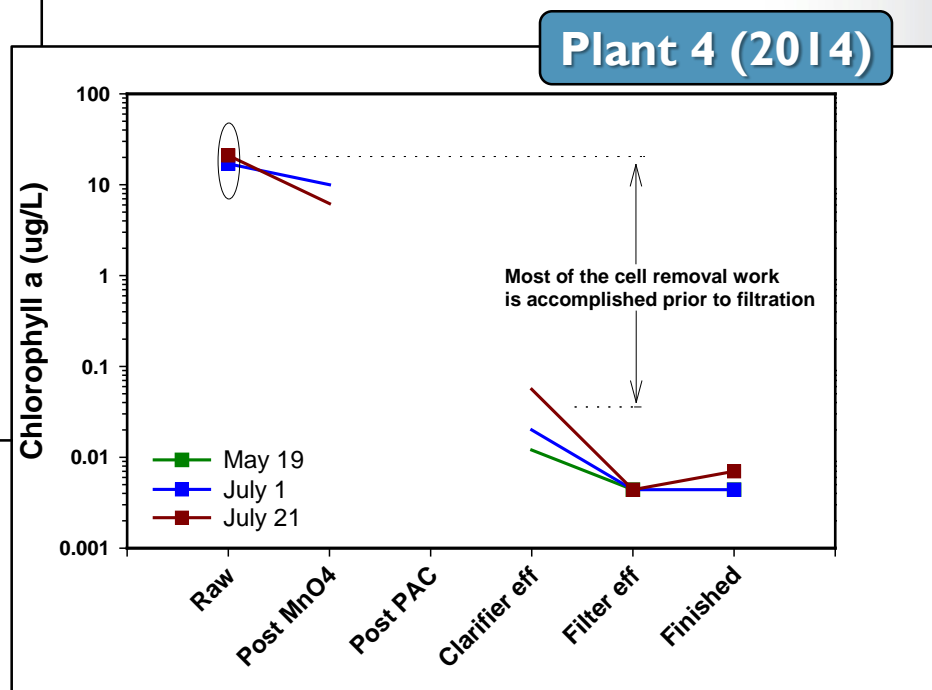

- ❖ Peak of a bloom season does not necessarily occur at the same time in a given year
- ❖ There may be more than one major bloom event

Chlorophyll-a Conc. Indicate Biomass is Effectively Removed Post-Clarification

As an proxy measure of intact cells, chlorophyll-a concentrations decreases across the treatment train

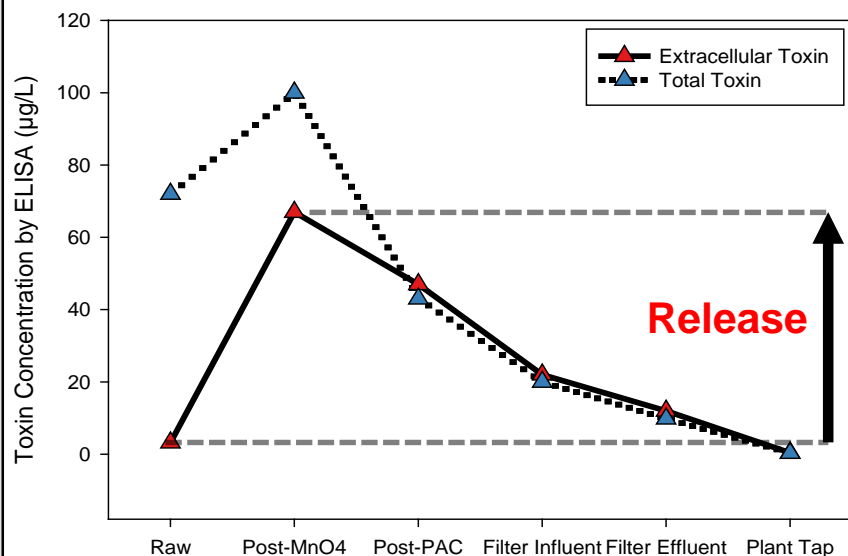

❖ Most cell removal was accomplished prior to filtration

Toxin Propagation through DWTP - ELISA vs LC-MS/MS

ELISA

Credit: Nick Dugan USEPA Treatment Stage

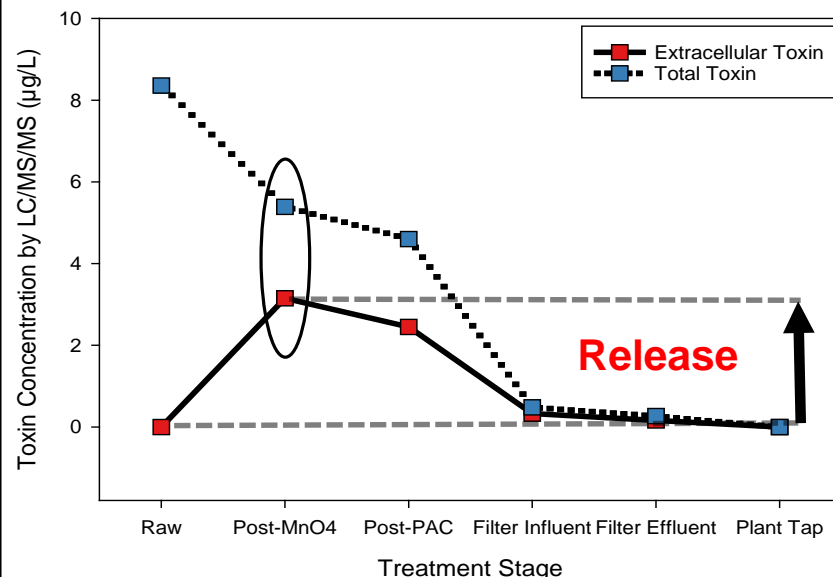

Unlike ELISA, total MYC measured by LC-MS/MS decreases after MnO_4 addition

- However, only 8 MYC (and NOD) variants were measured

Intracellular toxin release following MnO_4 addition
Added at crib intake, some residency/ contact time occurs before entering at the head of the treatment train

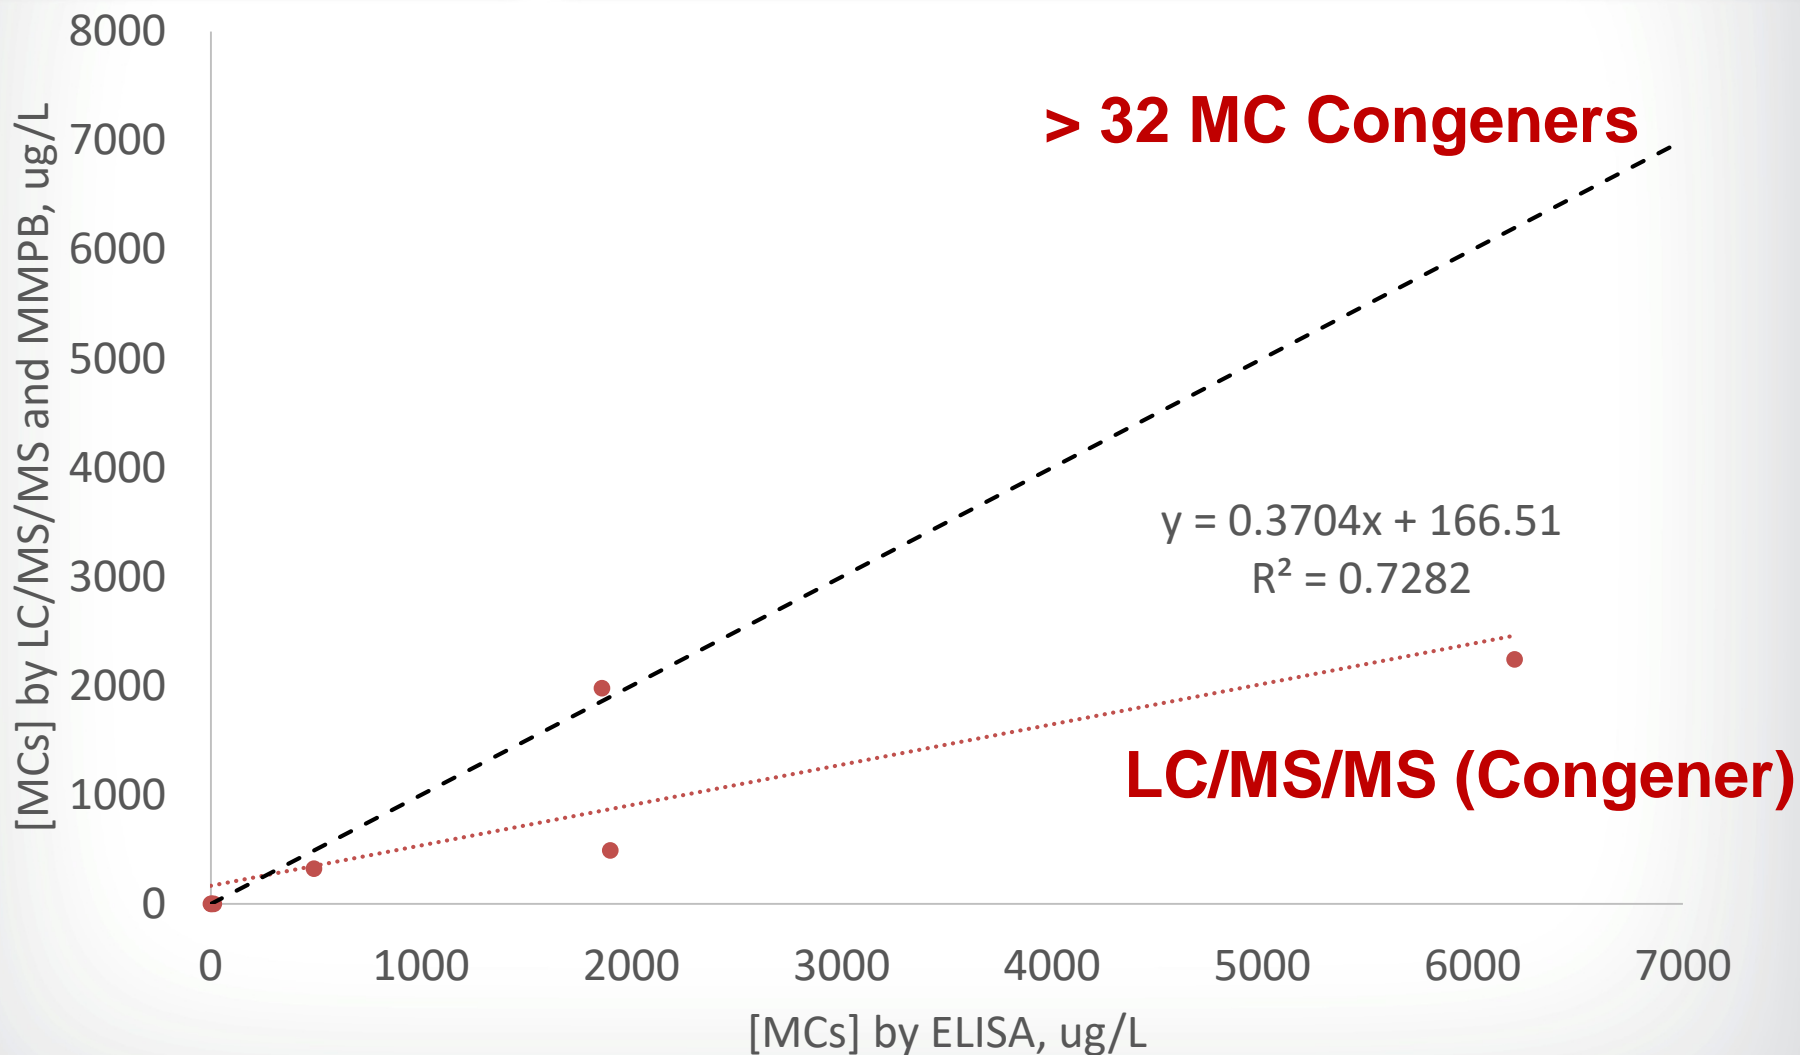

- Zebra mussel and taste & odor control

LC-MS/MS

Comparison of Total MCs by ELISA and LC/MS/MS (Lake Harsha)

Comparison of Total MCs by ELISA and LC/MS/MS (Lake Harsha)

Lake Harsha Sample SRM Chromatogram

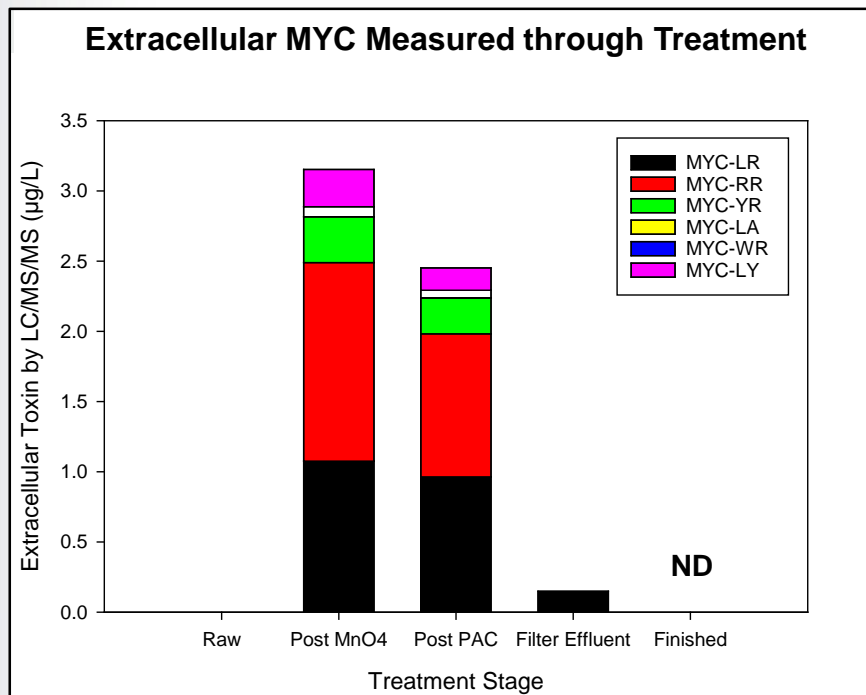

Why the difference?

- Non-targeted MC variants
- Need to ensure similarly massed variants are not misidentified
chromatography and confirmation ions are important

Toxin Speciation and Propagation - LC-MS/MS

- ❖ Significant diversity in toxin variants
- ❖ Both extracellular and total MYC concentrations decrease through the treatment train; no MYC observed in finished water

Ozonation and Intracellular Toxin Release

- ❖ Ozone effectively lysed cyanobacteria
- ❖ However, the applied ozone dose was not sufficient to further remove toxins from post-ozonation water

- ❖ Lake Erie water quality was significantly degraded in the western basin as compared to the eastern basin
- ❖ The bulk of toxin in treatment facility influents was intracellular
- ❖ Therefore, if this holds true, a facility originally designed for particulate control (conventional particulate removal strategies - coagulation, flocculation, sedimentation, filtration) are effective in removing biomass, hence intracellular toxins trapped within intact cells, and can serve as an effective barrier against exposure
- ❖ Powdered activated carbon reduces the extracellular toxin
 - Treatment facilities are currently adding oxidants and powdered activated carbon (PAC) at significant expense and uncertain effectiveness
- ❖ Preliminary evidence indicates that common doses of oxidants (i.e. permanganate) are sufficiently high to damage cells and release toxins, yet may be too low to completely degrade the released toxin
- ❖ More must be known about the formation and control of cyanobacteria and their toxins to assure safe drinking water

Special Thanks to:

- *The various Lake Erie DTWPs*
- *Ohio EPA*
