Overview

- Background
- Goals
- Methods
 - Dataset
 - Quality assurance methods
 - Correction methods
- Results
 - Error
 - Reported Air Quality Index (AQI) values
 - Results by state
- Conclusions
- Next Steps

\$EPA

- Cost: ~\$250
- 1,000's deployed worldwide

Goal

To develop a correction that can improve PurpleAir PM_{2.5} measurements across the U.S.

 To be used by PurpleAir and/or various users (local agencies, community groups, exposure scientists)

Balance:

- Broad applicability
- Simplicity of use
- Best correction method

Dataset

All sensors collocated by air monitoring agencies (Thank you!)

- Communicating with all partner agencies to ensure collocation and to glean additional details on sensor siting
- Note: This removes some of the uncertainty associated with using PurpleAir data as usually you cannot confirm they are correctly located on the map

24-hour averaged Federal Equivalent Method (FEM) and Federal Reference Method (FRM) data downloaded from Air Quality System (AQS)

Previous work:

- typically small number of sensors (~<10) in a single region
- some studies not collocated

Batchgeo.com

Collocation sites

Phase 1: Sites included in this presentation ND Phase 2: Sites added soon MN ME SD Phase MI OR ID WY NE ed State NV NM TX

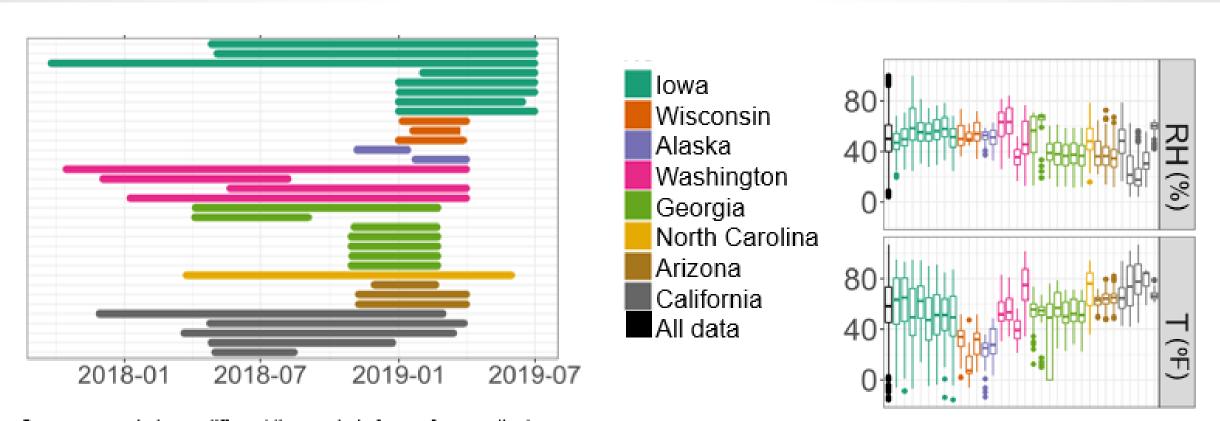

Notes about the dataset

- Primarily online but a few offline
- Public and private sensors
- Operating for different time periods and lengths of time

Dataset time periods

Sensors operated over different time periods from a few months to almost 2 years

24-hr temperature (T) and relative humidity (RH) across sites as measured by the PurpleAir sensors. Some sites ran for a single season resulting in T & RH not representative of the typical annual climate

Cf=1 and Cf=atm corrections

PurpleAir provides PM data with two corrections

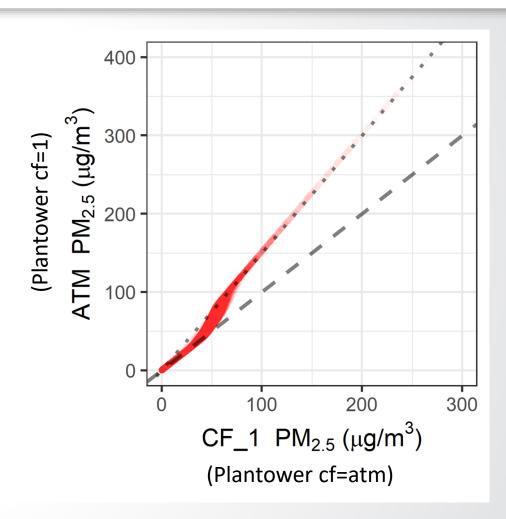

- Displayed on the map: cf=1
 - Plantower cf=atm output
- Also: cf=atm
 - Plantower cf=1 output

Note: since flipped labels were identified, the column names have been flipped in the sensor list output

A fix may be coming to the other datasets soon

PurpleAir cf=atm selected for this work

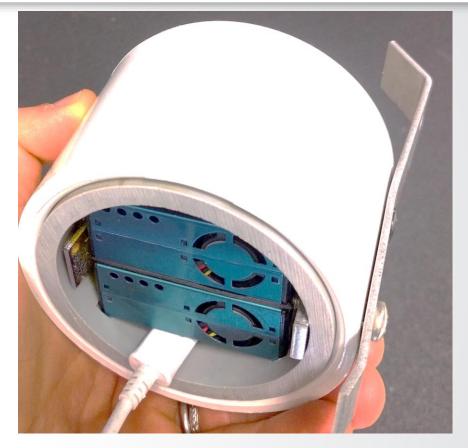

• cf=atm $R^2=0.65 > cf=1 R^2=0.64$

QA: A & B channels

- 2 Plantower PMS5003 (channels A & B)
- Sample for alternating 10-second intervals
- Generate 2-minute averages
 - previously 80-second

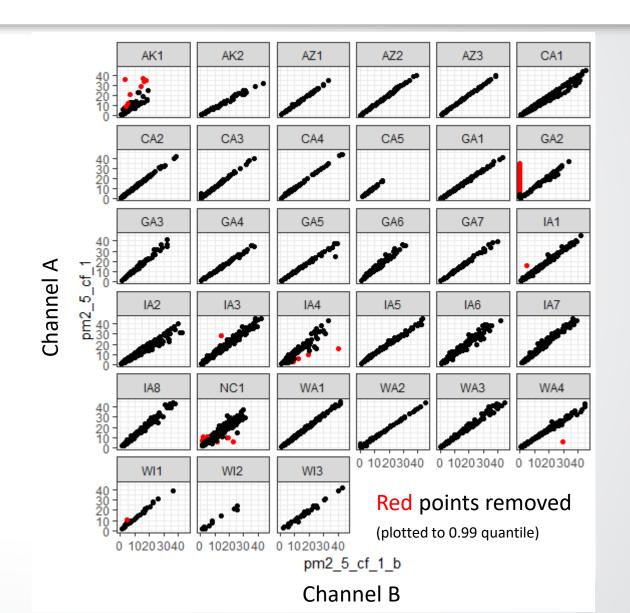

PurpleAir underside view

QA steps

- Only 24-hr averages with at least 90% of the data present were used
- Points removed if 24-hr averaged A & B PM_{2.5} differ by:
 - $\geq \pm 5 \mu g \text{ m}^{-3} \text{ AND}$
 - $\geq \pm 16 \%$
 - 2*sd(% error)
 - 2% removed
- A & B channels averaged
 - Slightly improves overall R² and confidence on linear regression
 - More important for individual sensors

SEPA

Equations considered

- **Raw:** $PM_{2,5} = PA$ (raw PurpleAir $PM_{2,5}$ cf=atm)
- **Linear:** $PM_{25} = a*PA + b$
- 3. **T & RH:** $PM_{25} = a*PA + b*T + c*RH + d$

Units:

 $PM_{2.5} = \mu g \text{ m}^{-3}$

T=0F

RH=%

Other parameters considered:

- Pressure (not available for all sensors)
- Other T & RH functions
 - Selected equation is more broadly applicable than T*RH*PM
 - Strong nonlinear RH influence not seen in most states
- Size bin data: minimal improvements
- Duration deployed: More data needed from sensors operating ≥ 1 year
- State: Seasonal influences may dominate since <1 year of data in many states

Equations considered

- 1. Raw: $PM_{2.5} = PA$ (raw PurpleAir $PM_{2.5}$ cf=atm)
- **2.** Linear: $PM_{2.5} = 0.38*PA + 2.94$, $R^2 = 0.69$
- 3. T & RH: $PM_{2.5} = 0.39*PA + 0.0024*T 0.050*RH + 5.19, R^2 = 0.72$

Units:

$$PM_{25} = \mu g \text{ m}^{-3}$$

Statistics used for evaluation

Mean Bias Error (MBE): Accuracy

• The average difference between the PurpleAir and FEM or FRM measurements

Root Mean Square Error (RMSE): Precision

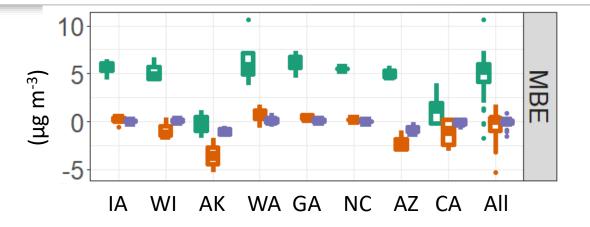

- A measure of the spread between the 24-hr PurpleAir and FEM or FRM measurements
- Since it is squared it penalizes outliers

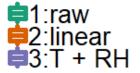

Spearman correlation: Measure of association

• Similar to pearson correlation or R² but for non normally distributed datasets

- Linear correction reduces bias (MBE) except:
 - AK
- T + RH correction reduces state bias in all states **especially**:
 - AK, CA, AZ

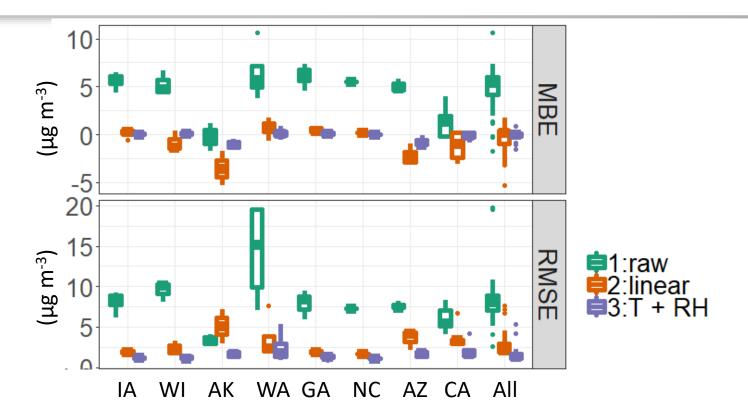

Each point on the boxplot is a single PurpleAir sensor

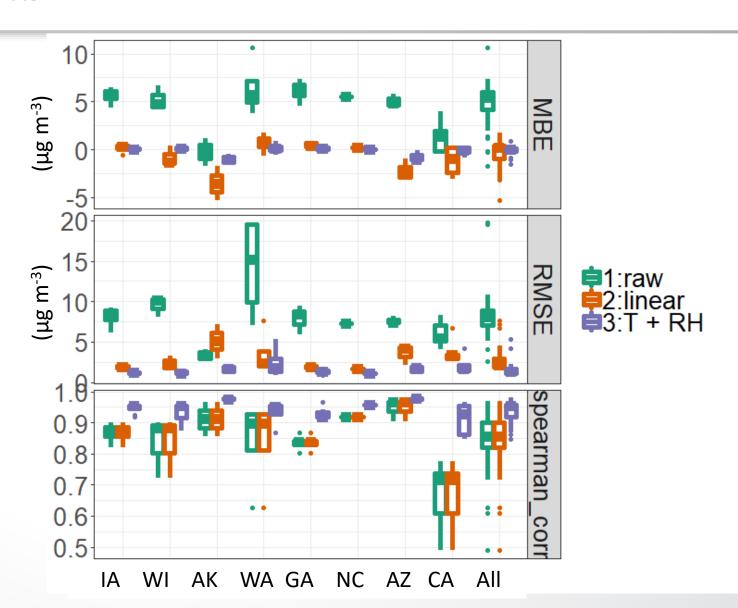

- Linear correction reduces RMSE except:
 - AK
- T + RH correction reduces RMSE in all states

 Spearman correlation improved using T + RH correction in all states

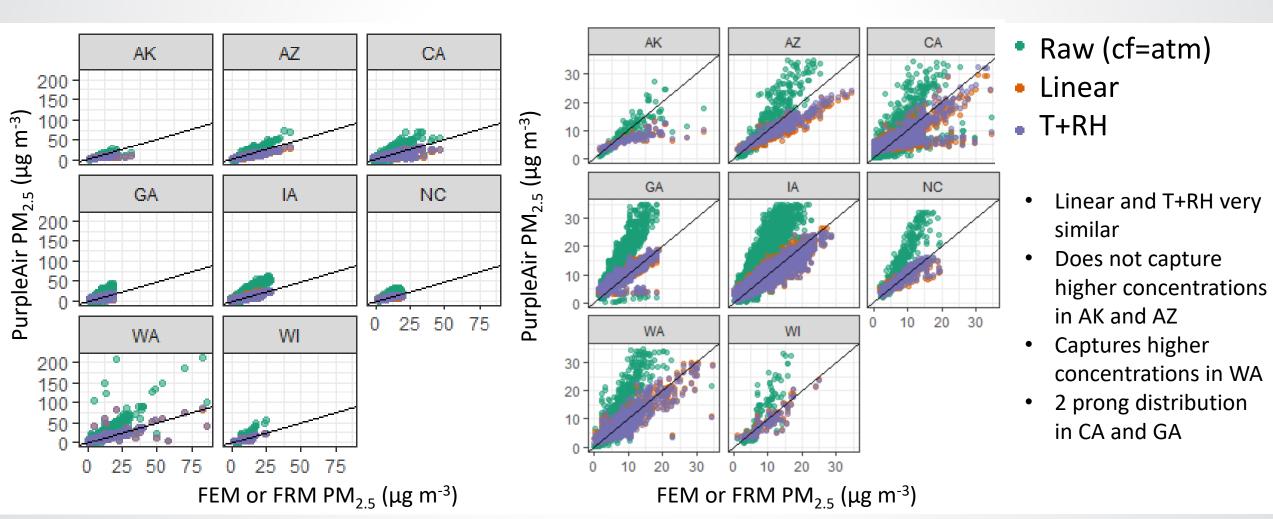

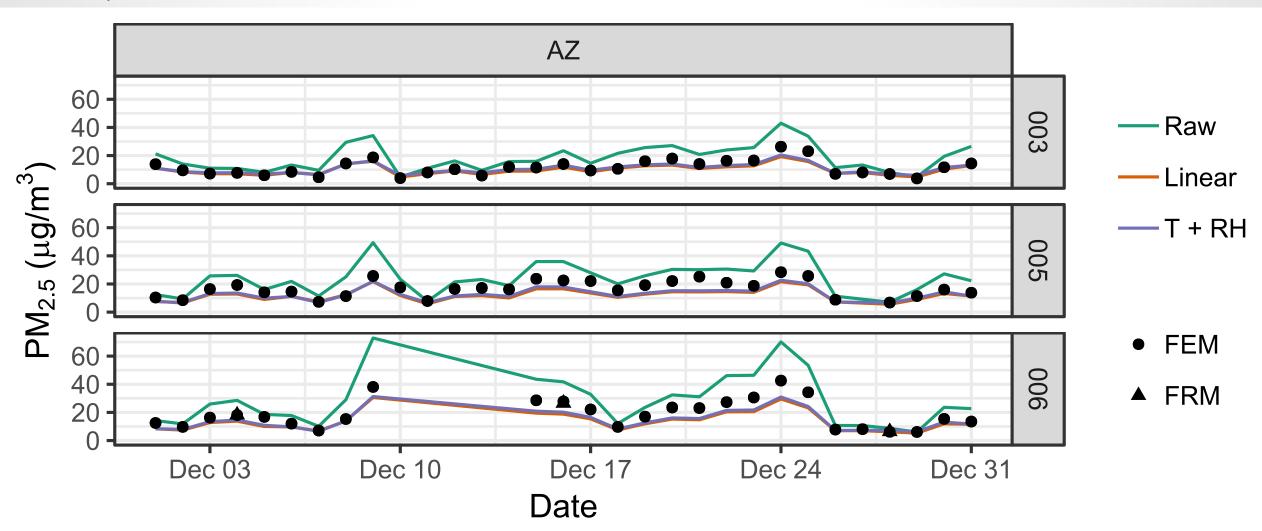

Results by state

Arizona

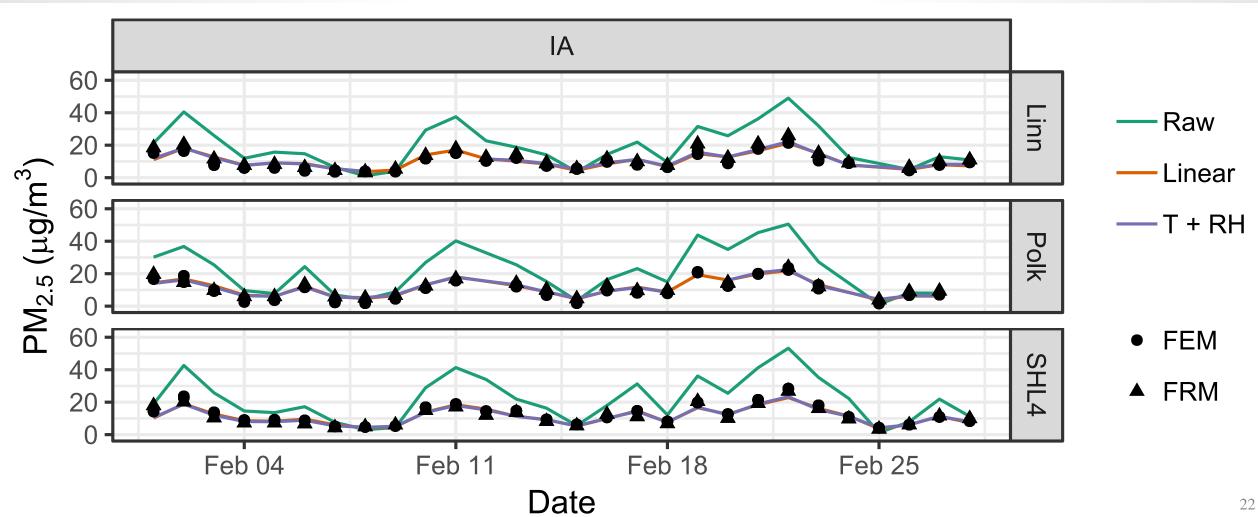

3 example sites from Phoenix Arizona

Iowa

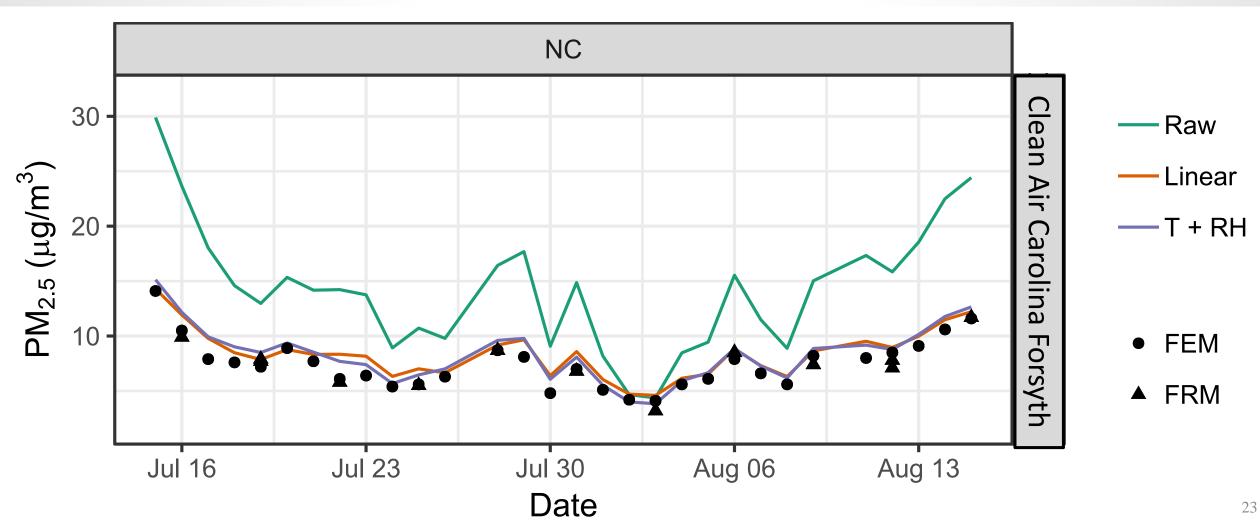

3 example sites from Iowa

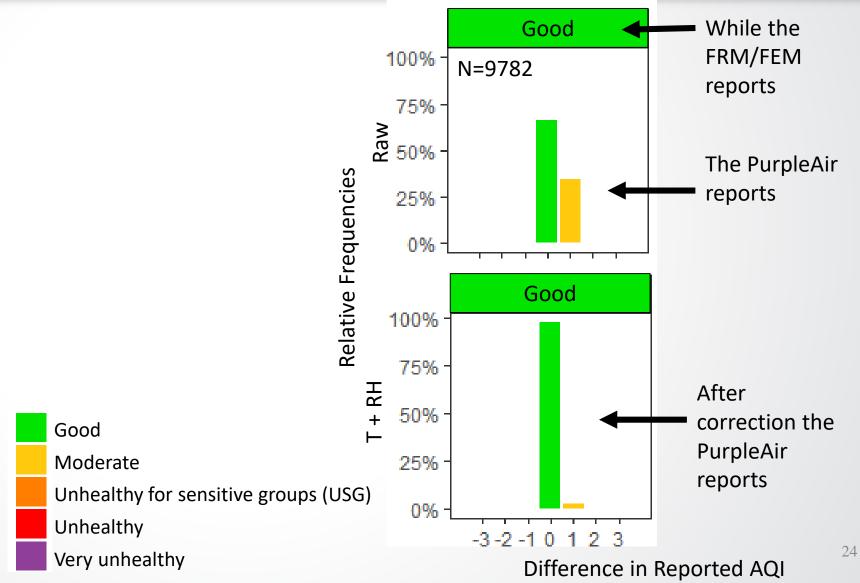

North Carolina

example site from Forsyth County, North Carolina

AQI reporting: Good-Moderate

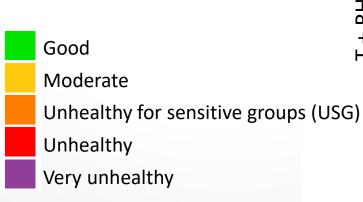

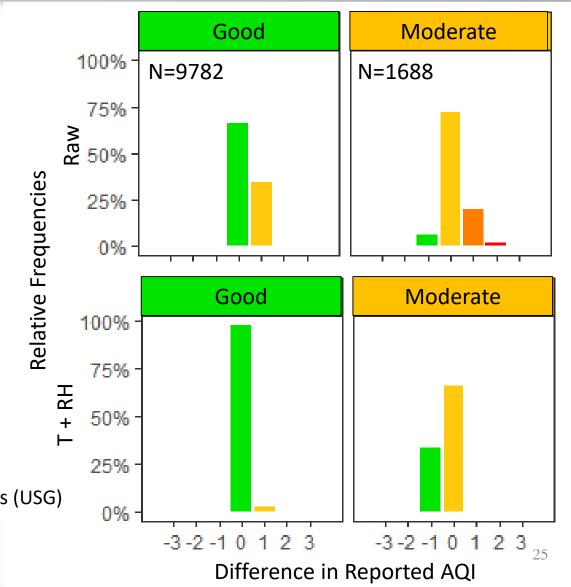

AQI reporting: Good-Moderate

Raw PurpleAir often over reports AQI

 This is important to note as this is what is being displayed and viewed by many of the PurpleAir map

Correcting causes under reporting at moderate AQI

AQI reporting: USG-Unhealthy

Limited data at higher AQI

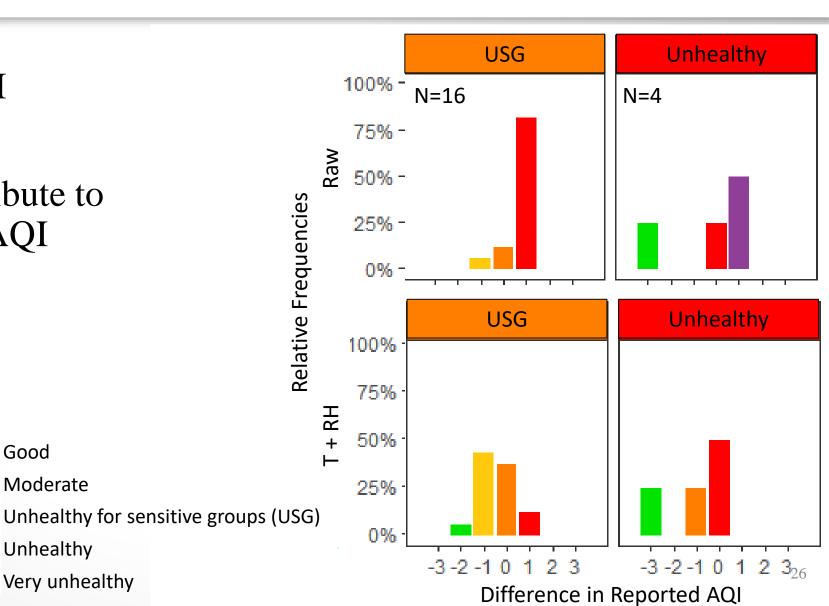

Correction also may contribute to under reporting at higher AQI

Good

Moderate

Unhealthy

Very unhealthy

Conclusions

- A U.S. wide correction including T & RH could improve PurpleAir performance in terms of MBE, RMSE, and correlation across the U.S.
- Even a simple linear correction would significantly improve performance in most parts of the U.S.
- Currently PurpleAir often over reports AQI category
- Proposed corrections may not improve higher category AQI reporting
 - Amara Holder (EPA) is specifically exploring performance under wildfire conditions
 - Working to add more high concentration data to improve model performance at high concentration

Limitations:

- Limited high concentration data
- Unknown applicability at shorter time intervals
- Real-world PurpleAir data has additional uncertainty with reported location

Next steps

- Explore additional collocated data provided by partners
- Explore higher time resolutions data (1-hr)
 - Are agencies interested in 2-minute data?
- Further explore performance over time as more sensors operate for 1 year
- Explore data from wildfires
- Explore the long term performance of additional sensor types across the U.S.

Discussion

Partner agencies: Any initiative or project you would like to discuss?

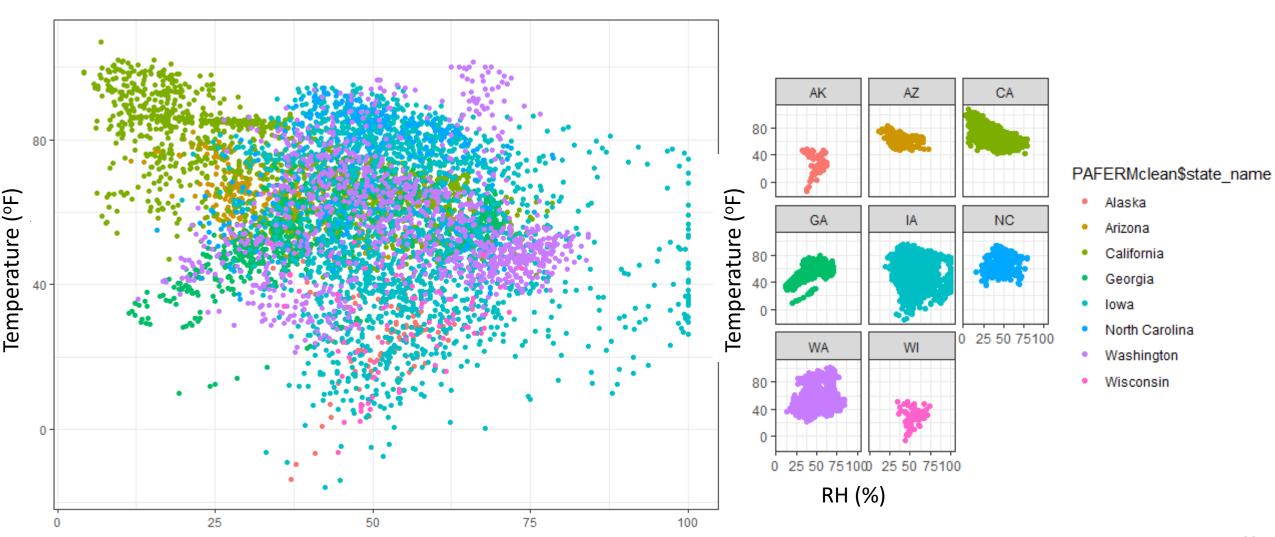

Extra slides

RH (%)

Dataset: temperature and RH

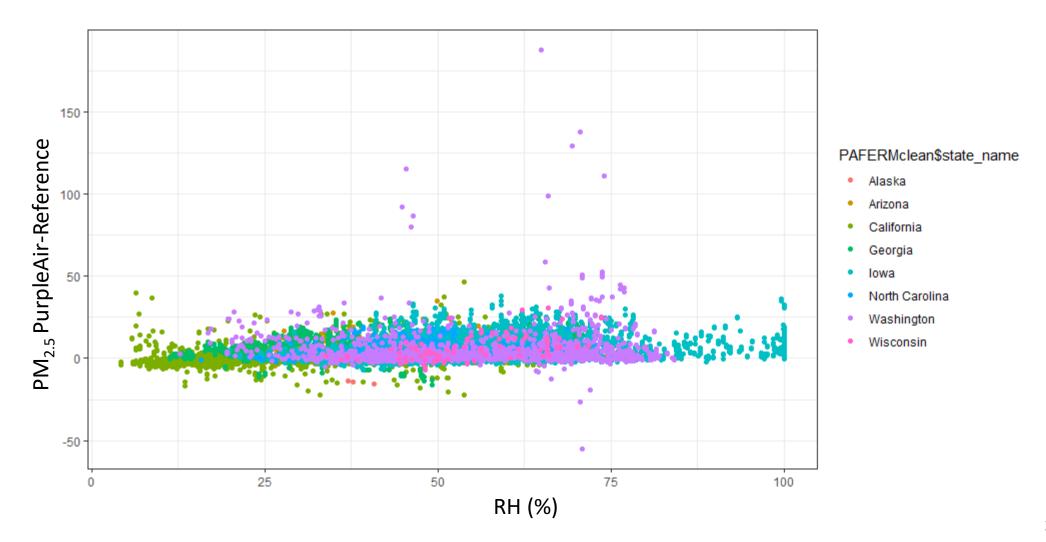

Parameters considered for multilinear regression

- PM_{2.5} cf=atm and cf=1 channels
 - Cf=atm slightly stronger correlation (cf=1 from Plantower)
- Relative humidity
- Dewpoint
 - RH explained more error
- Temperature
 - T in both °F and K considered but both provide the same results just different coefficients
 - Marginally significant may remove based on results of full dataset (p=0.05)
- Pressure
 - Missing from 22% of the dataset
- Size bin information (reported to reduce detection limit)
 - reduces error <1%
- Duration deployed
 - full dataset suggests intercept decreases by 0.77 µg m⁻³ after a year of use
- Location (state, region, etc.)
 - Correction less broadly applicable especially since many state datasets do not have all seasons

Only considering parameters available from PurpleAir

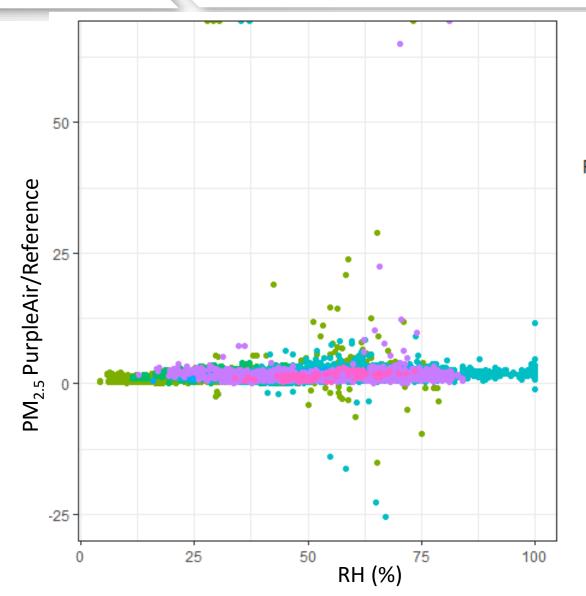

RH: sensor-reference

RH: sensor/reference

PAFERMclean\$state_name

- Alaska
- Arizona
- California
- Georgia
- lowa
- North Carolina
- Washington
- Wisconsin

No distinct pattern between A& B channels over time

- $R^2=0$ (p=0.02)
- Also no significant relationship time deployed vs. ref-PA difference
