Retinoid Signaling in Skeletal Development:
Scoping the System for Predictive Toxicology

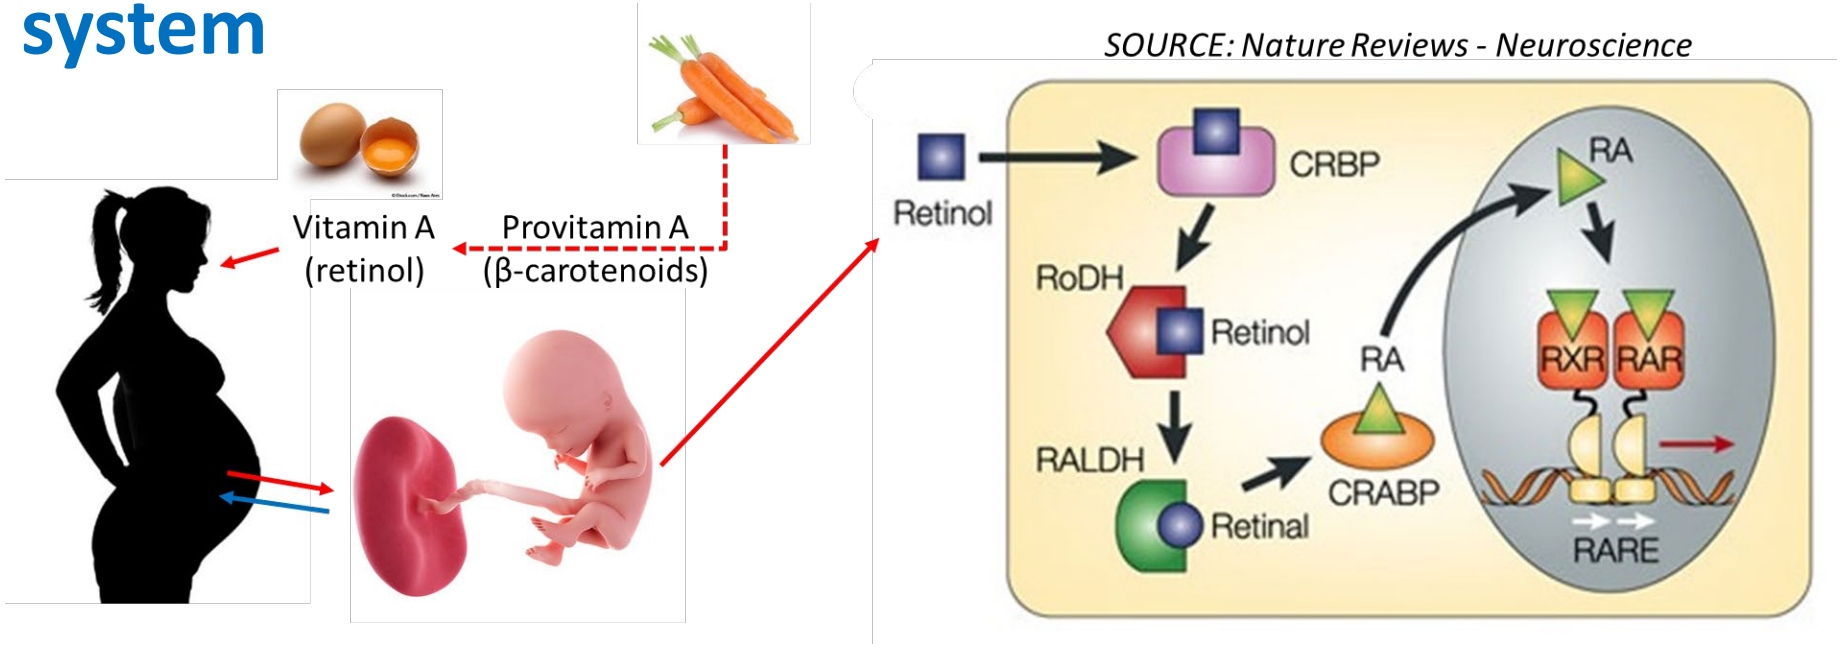
Scope and relevance of this annex

- Retinoids influence development: reflected in the ancestry and conservation of genes for retinoid signaling, from gastropods to humans.
- Two major themes relevant to state of science: (1) role of endogenous retinoids, their receptors, and cellular effects; (2) chemical disruption during pregnancy.
- A common theme between developmental processes and toxicities is the regulation, homeostasis, and physiology of retinoic acid (biologically active form of vitamin A).
- RA signaling collaborates with patterning the embryo: altered skeletal morphology is a common outcome following genetic or chemical perturbation.
- Case study approach: chemicals that interact with retinoid pathway targets (*in vitro* data) and quantitative models (*in silico*) for adverse skeletal phenotypes (*in vivo*).

Retinoid system



- Vitamin A (retinol), unlike many vitamins, can be stored in several tissues (eg, liver, RPE) and mobilized as needed; however, unlike endocrine hormones the active ligand (atRA) is not produced at a specific gland.

- Maternal vitamin A (retinol) conveys via retinol-binding protein, freely crosses the placenta to enter the embryonic circulation, and is locally activated to retinoic acid (atRA) and binds its nuclear receptors (RARs);

- RAR/RXR heterodimers bind cognate ‘RARE’ elements having a direct repeat (DR) hexanucleotide spaced by five nucleotides (DR5); lesser spacing converts RXR specificity to other nuclear receptors.

RA signaling

- RA was the ‘first morphogen’ characterized in vertebrate embryos [Thaller and Eichle, 1987].
- Control of RA production (RDH/RALDH2) and degradation (CYP26 a/b/c) is critical for proper skeletal development;
- over 500 RA-responsive genes regulate many biological processes at the cellular, tissue and organ levels;
- form positive and negative feedback loops with key morpho-regulatory signals (SHH, FGF, WNT, TGFbeta, RTKs, …);
- WOCBP on retinoid therapy (eg, Accutane for acne) must be wary of the ‘Fetal Retinoid Syndrome’.

Suboptimal atRA production

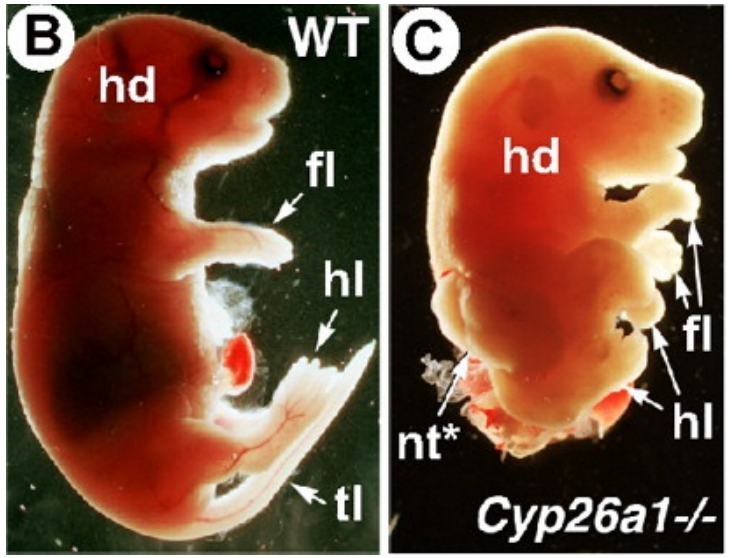
Suboptimal atRA breakdown



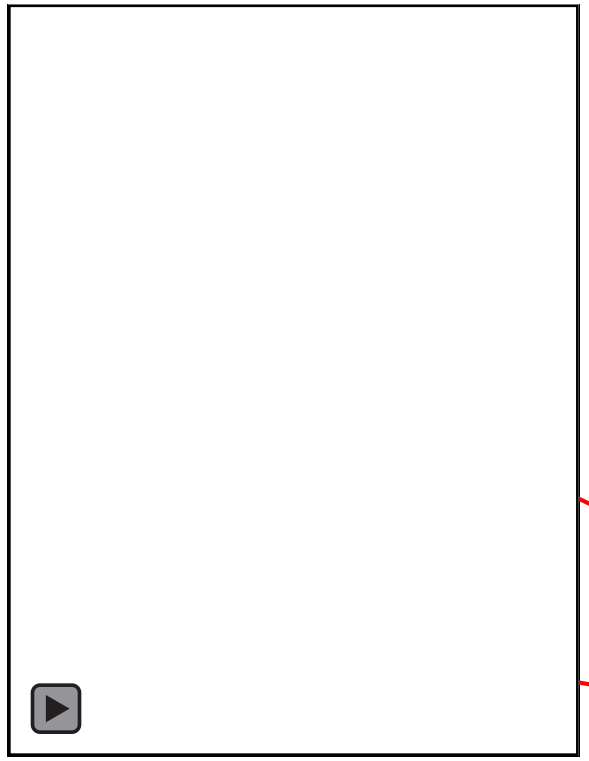
SOURCE: Rhinn and Dolle (2012)

Skeletal development

- The fetal skeleton (>200 bones) is routinely examined in standard developmental toxicity bioassays (e.g., OECD 414) and has proven to be sensitive to a wide variety of chemical agents [5,6].

- Annex reviewed concepts in retinoid signaling that are generally distinct for three skeletal fields, investigating normal regulation by endogenous RA and abnormalities induced by exogenous retinoids:

https://embryology.med.unsw.edu.au/embryology



craniofacial skeleton
(*neurocranium, viscerocranium*)

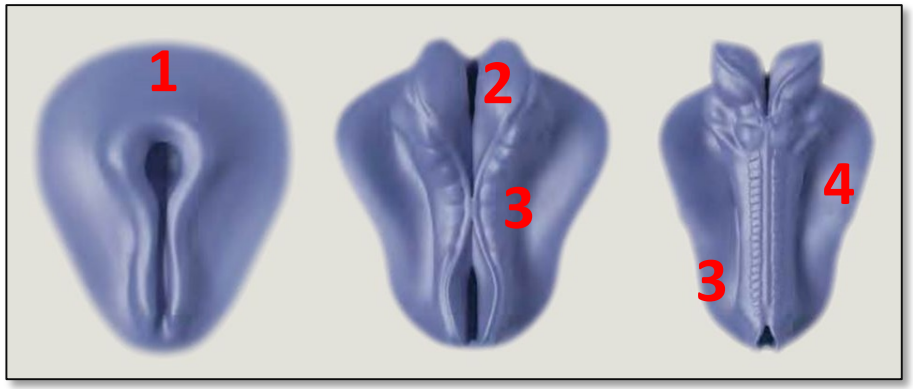
axial skeleton
(*ribs, sternum, vertebral column*)

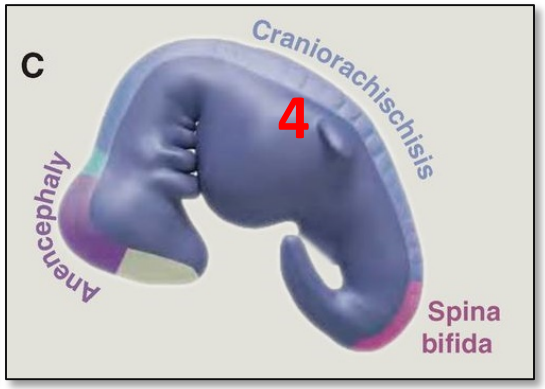
appendicular skeleton
(*upper, lower limbs*)

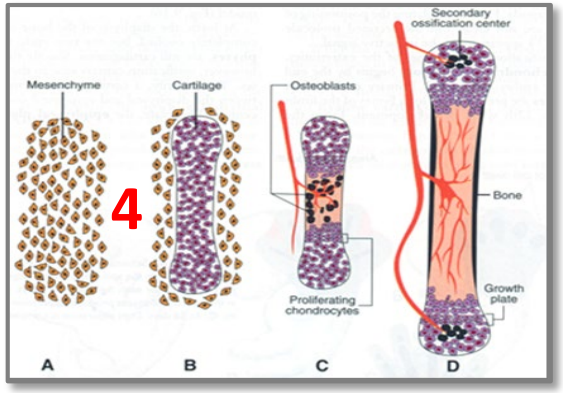
sciencephoto.com

Stage-specific morphogenesis of retinoid-sensitive structures

1. **Presomitic**: appearance of notochord and interaction with floor plate of the neural tube patterns the primary body axis (neuraxis) that subsequently elongates during neurulation.







2. **Craniofacial:** retinoid effects closely linked to patterning cranial neural crest cells (CNCs) prior to their emigration from the anterior neural tube (hindbrain).

3. **Axial:** vertebral column segmentation has its origin in somitogenesis - somites spur cells (sclerotome) that migrate medially around the neural tube and elsewhere to form ribs and sternum.

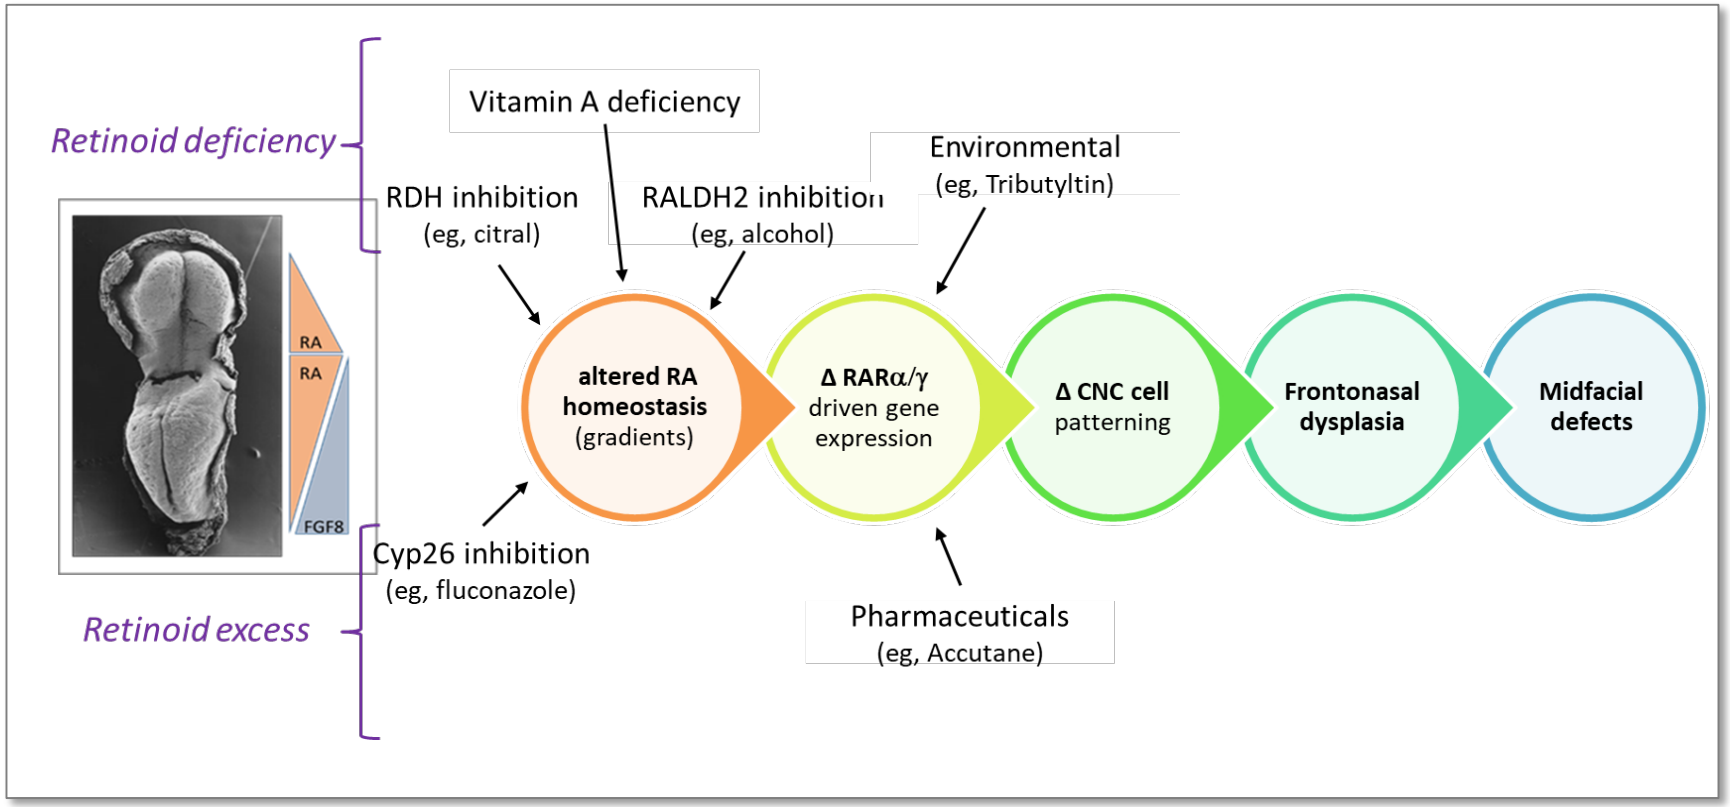
4. **Appendicular:** important considerations for limb-bud prepatterning and subsequent differentiation (chondrogenesis, osteogenesis, vascularization).

Generalized AOP framework

- End-goal is a performance-based model of the retinoid system for predictive toxicology that addresses the regulation, homeostasis, and biological activity of the retinoid signaling pathway.
- An AOP framework is necessary to organize the *in vitro* data and *in silico* models and help identify relevant analytical tools, statistical relationships and insight into the biological domain.
- Despite a wealth of information on retinoid signaling pathways during development, only two literature reports refer to an AOP for the retinoid system [Tonk et al. 2015, Baker et al. 2018].
- Searching the AOPWiki [https://aopwiki.org/] for 'retinoic acid' or 'retinoid' returned key events for only 5 AOPs (#ID = 43, 297, 7, 37, 38).
- Some information available for profiling the retinoid system *in vitro* (ToxCast/Tox21) and building performance-based models to predict skeletal dysmorphogenesis *in vivo*.

This Annex reviews literature on retinoid signaling pathways since 1970s as an initial conceptualization of an AOP framework for developmental toxicity of skeletal system.

Craniofacial AOP: Abstract Sifter query '*cranial development and (embryo or fetus)*' (August 2019) picked up 3747 records (1978-2019) with relevant MeSH headings; 158 contained '*retino**' for this review.



Adverse Outcome
retinoids primarily affect midface and branchial structures

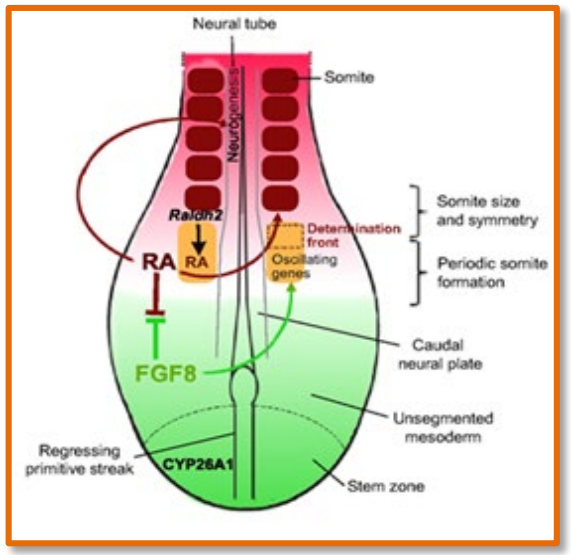
Molecular (MIE)
disruption of RA synthesis/breakdown → during gastrulation

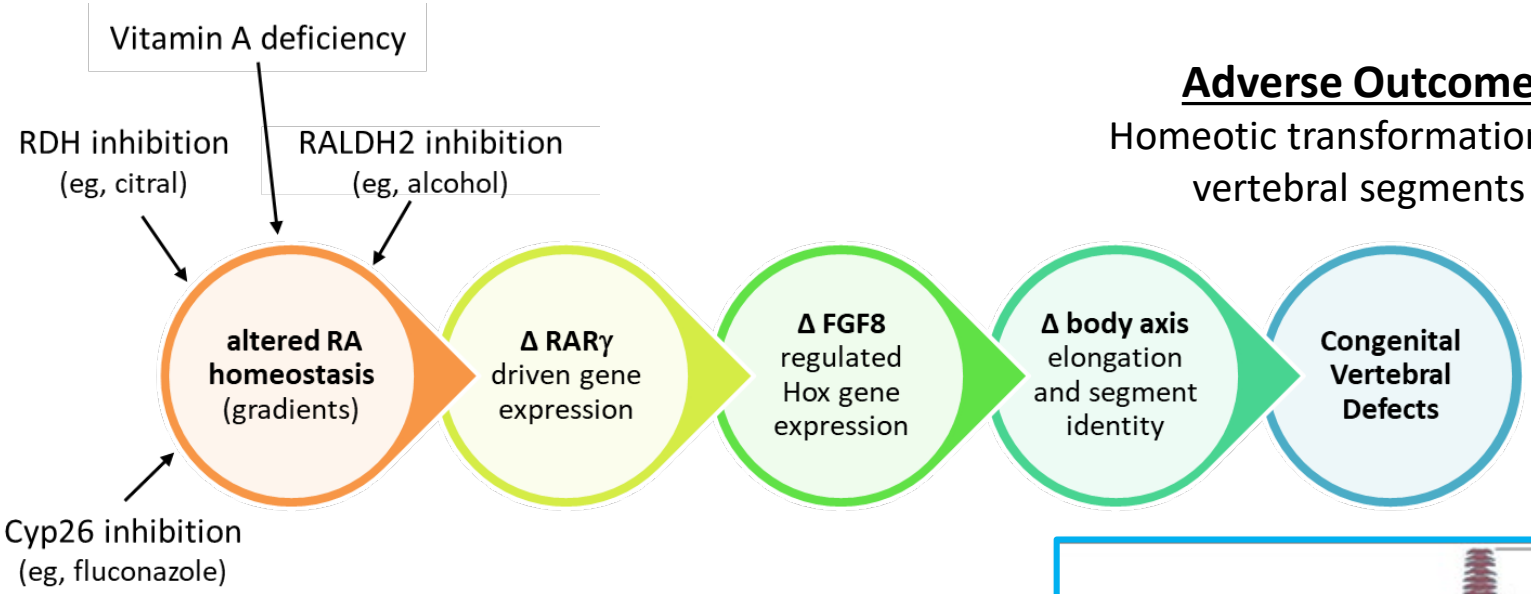
Neuroepithelium
RAR-driven gene expression in crosstalk with BMP, WNT, and FGF signaling

Cranial Neural Crest
misprogramming of migratory CNC functions during gastrulation

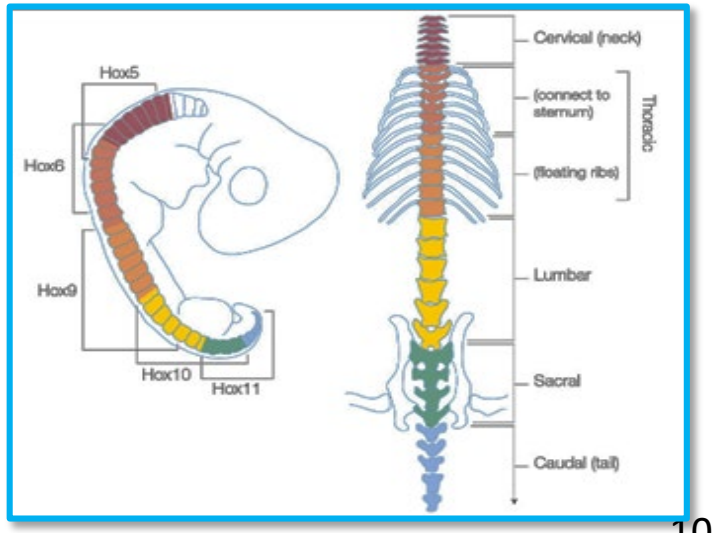
Dysmorphogenesis
altered CNC fate and behaviors (ectopic migration, ↑ apoptosis)

Axial AOP 1: Abstract Sifter query '*cranial development and (embryo or fetus)*' picked up 1679 records (1989-2019) with relevant MeSH headings; 80 contained at least one use of text '*retino**' for this review.



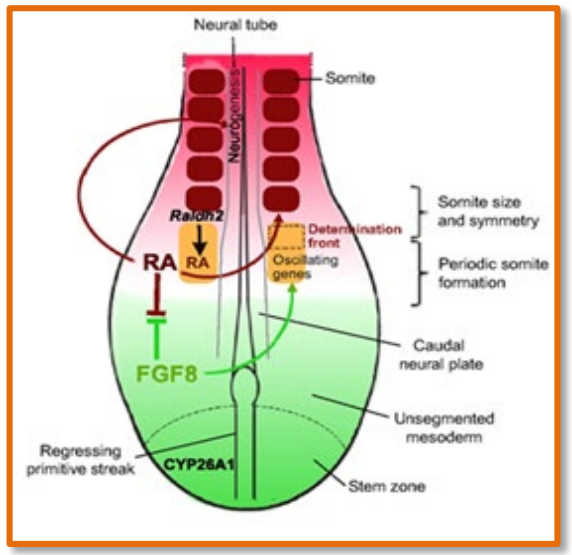


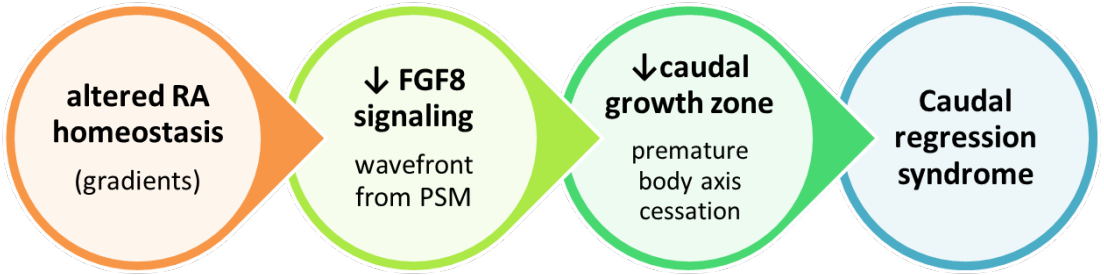
Adverse Outcome
Homeotic transformations of vertebral segments

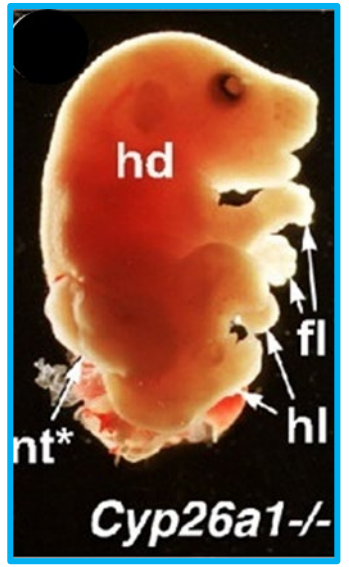


- retinoid signaling posteriorizes the neuraxis (gastrulation) → somites (neurulation)
- positional information encoded during gastrulation but decoded during somitogenesis
- result of complex interactions involving oscillatory activity of Notch and WNT signaling
- mutually antagonistic gradients of FGF8 and RA
- FGF8 wavefront (caudally) opposed by RA signaling (RALDH2 in newly formed somites)
- FGF8 and RA influence pattern of homeobox gene expression (HOX code)
- crosstalk with molecular clock genes determine periodicity.

Axial AOP 2: Abstract Sifter query '*cranial development and (embryo or fetus)*' picked up 1679 records (1989-2019) with relevant MeSH headings; 80 contained at least one use of text '*retino**' for this review.



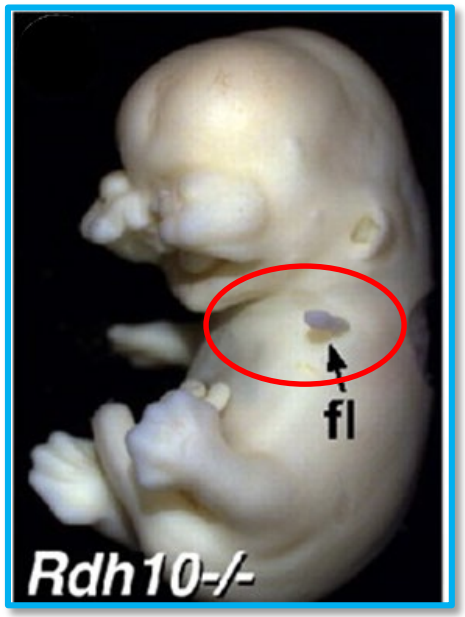


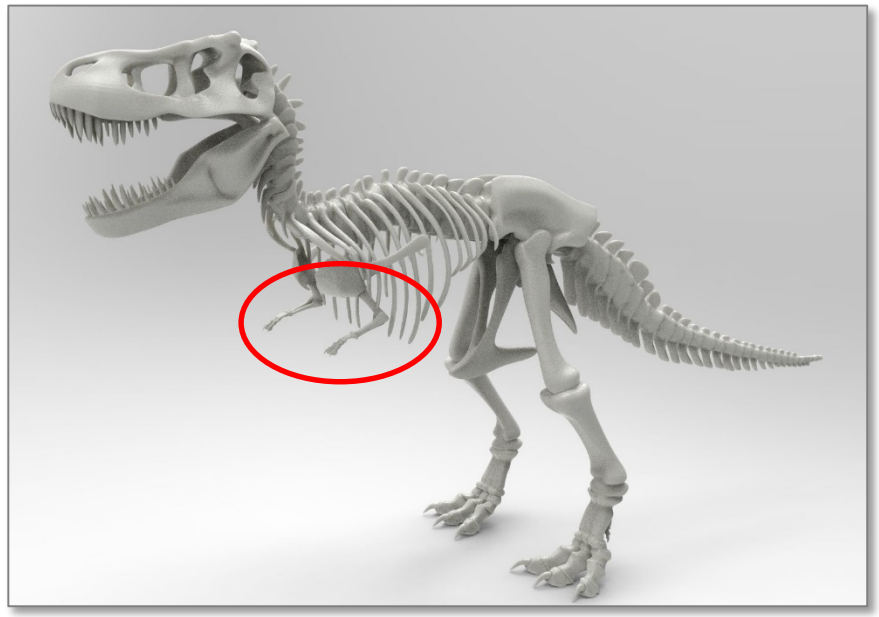


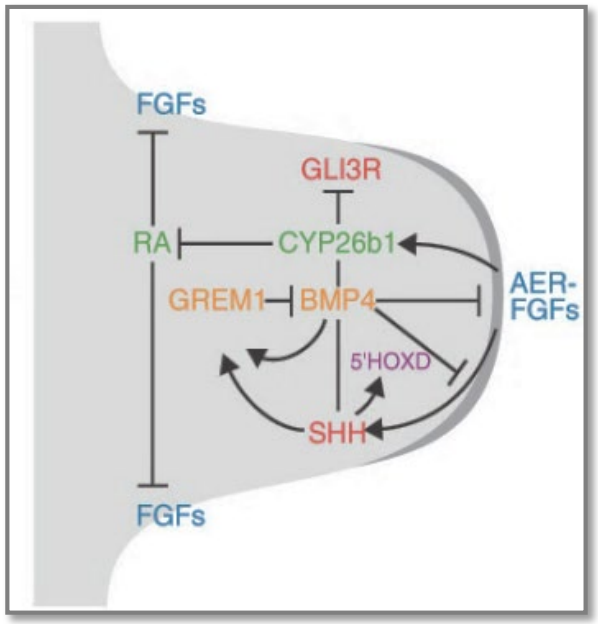
- rostral to caudal progression of somitogenesis during extension of the neuraxis
- draws from proliferating cells in presomitic mesoderm (PSM) of tailbud in response to FGF8
- FGF8 expression maintained in PSM (caudally) by WNT signaling
- anterior extent of FGF8 expression limited by RA (RALDH2) from newly formed somite
- caudal growth zone maintained by RA clearance (Cyp26a1)
- premature cessation of body axis elongation
- crosstalk with molecular clock genes determine periodicity in 'clock-and-wavefront' model.

Adverse Outcome
disruption of posterior axial elongation

Appendicular AOP: Abstract Sifter query '*limb development and (embryo or fetus)*' picked up 4470 records (1973-2019) with relevant MeSH headings; 299 contained at least one use of text '*retino**' for this review.

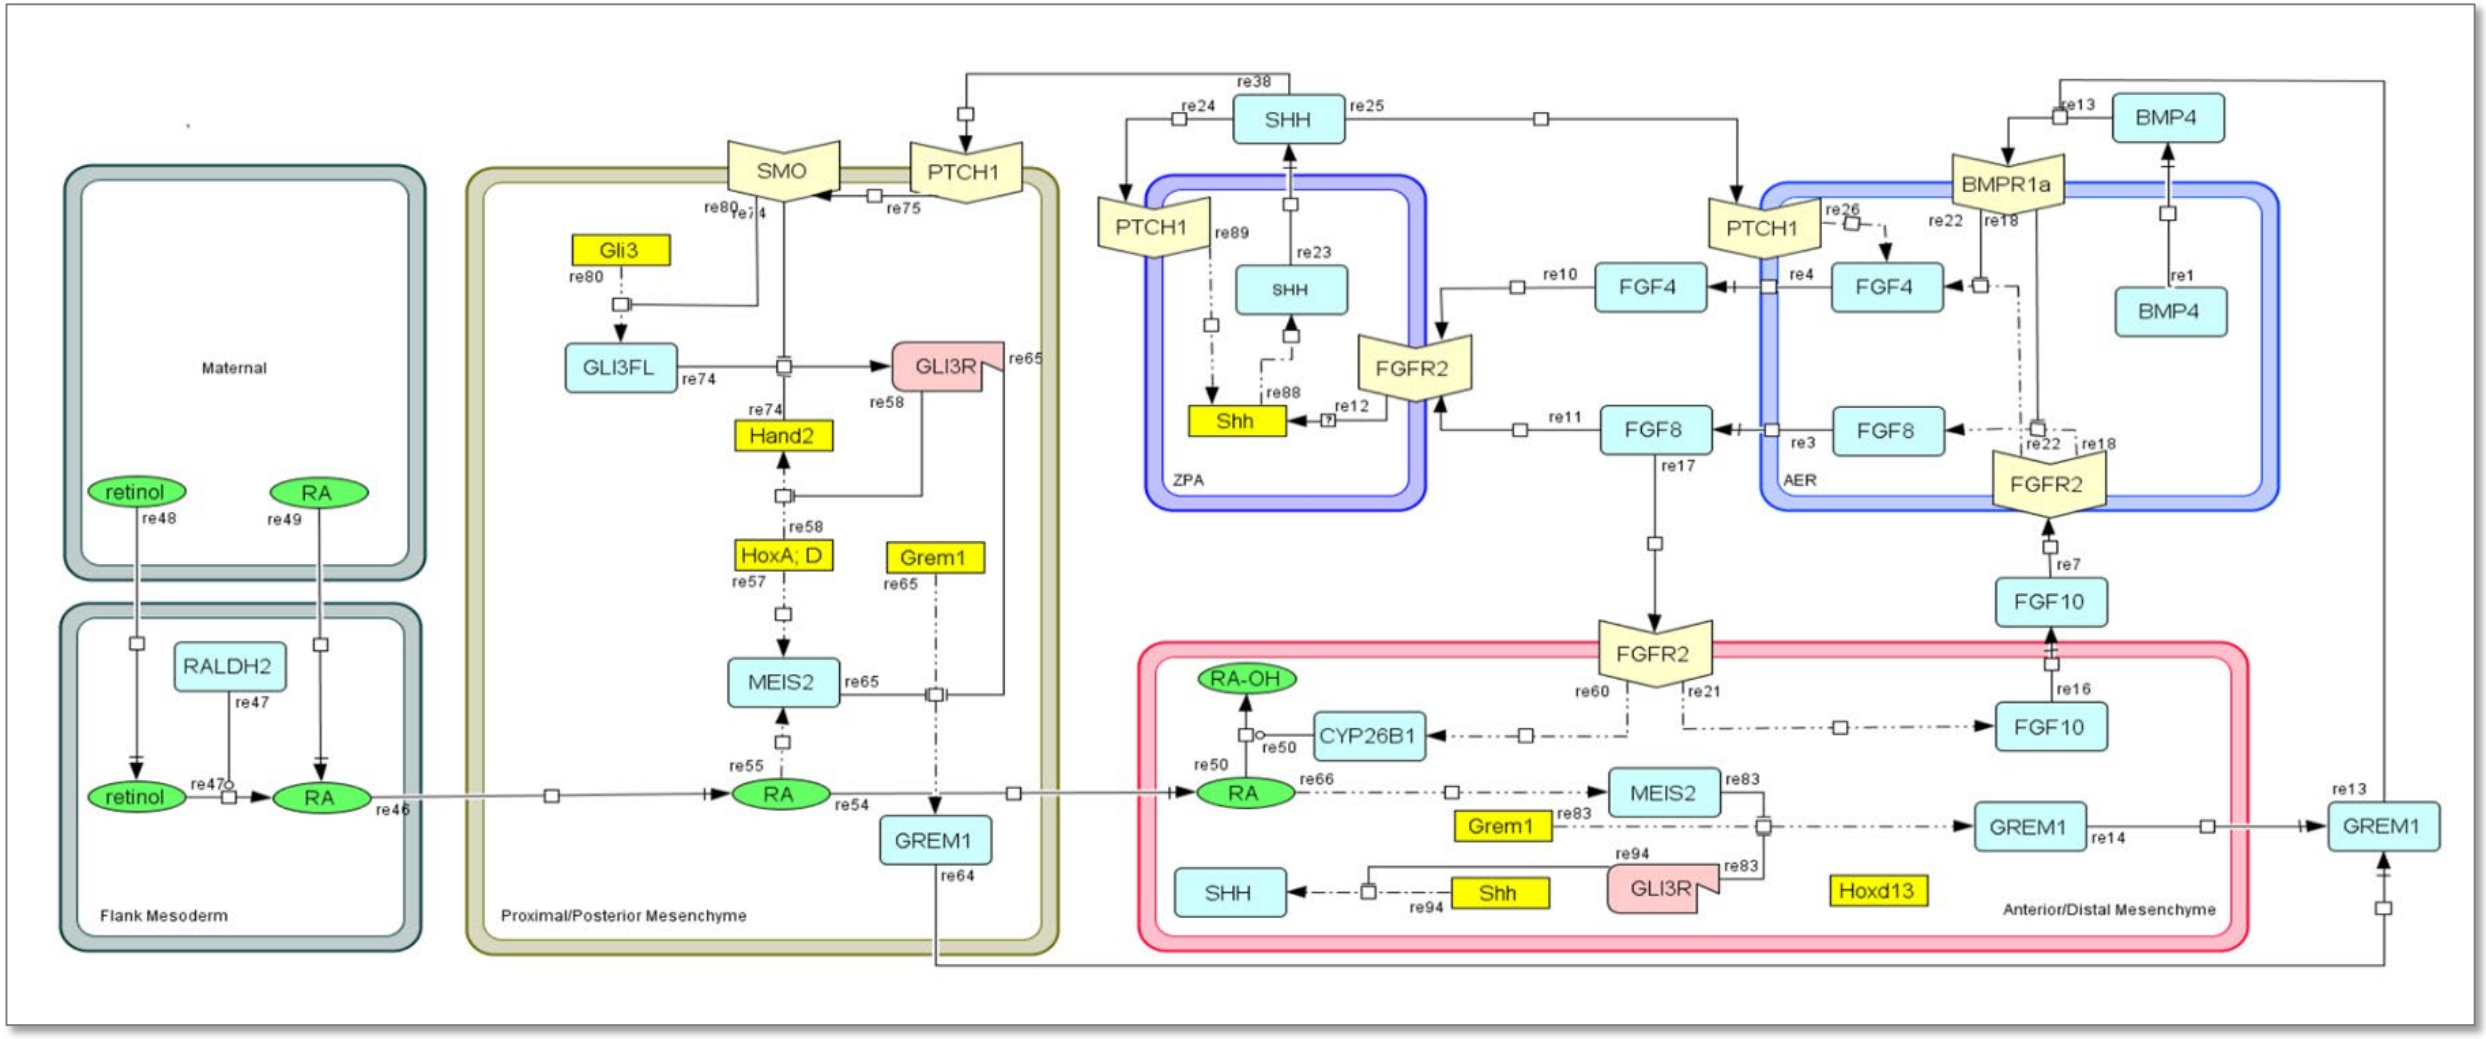






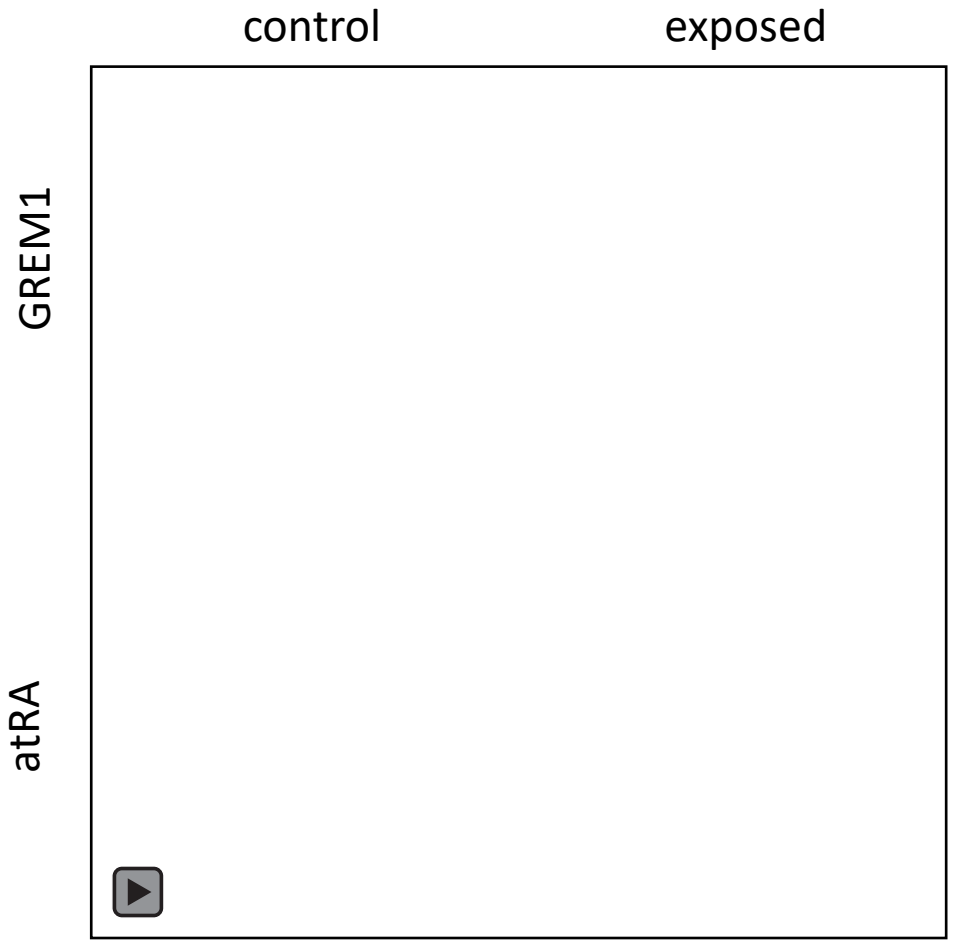
- a complete retinoid system exists in the limbs and somites during critical stages of appendicular patterning
- *Rdh-null* mouse embryos show stunted forelimbs and apparently normal hindlimbs reminiscent of *Tyrannosaurus rex*
- RA from somites enters limb-bud proximally and is degraded by CYP26B1 distally
- RA (through RARα/γ) proximalizes the limb-bud and facilitates distal anterior-posterior patterning via Hox genes
- RARs regulate the transition of precartilage anlagen to chondroblast differentiation
- retinoid teratogenesis on limb may be linked to RARβ hyperactivity and vascular disruption.

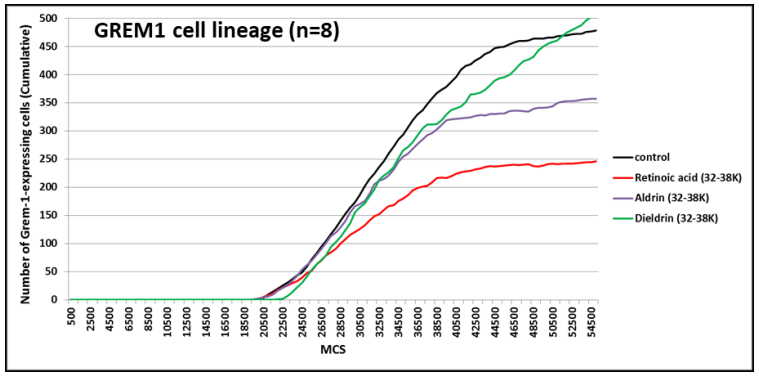
Control system: *more complex and dynamical than conveyed by an AOP network*

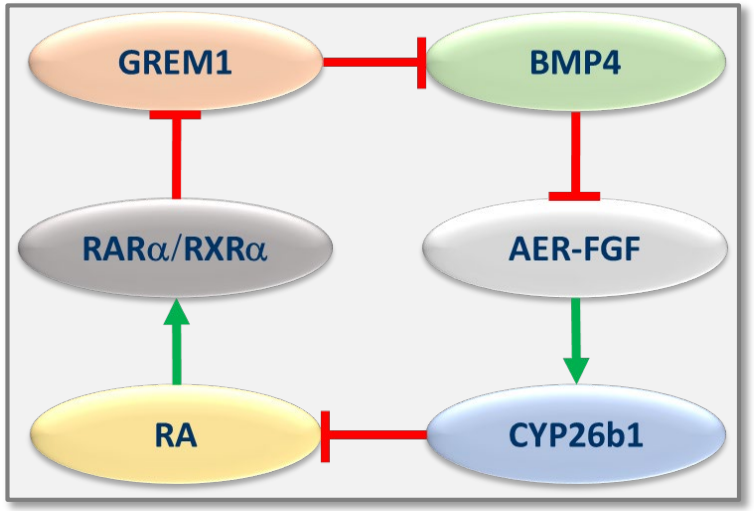


SOURCE: B Ahir (CCTE), CellDesigner

Computer simulation







Model suggests premature shutdown of GRM1-BMP4 loop is a key event terminating FGF-dependent limb-bud outgrowth associated with excessive RA signaling

Skeletal endpoints (developmental)

Toxicity Reference Database (ToxRefDB)
http://www.epa.gov/ncct/toxrefdb/
(Open access)

↓

Currently consists of 1,159 chemical across 6727 animal studies (subchronic, chronic, prenatal development, and multigenerational reproductive studies)

↓

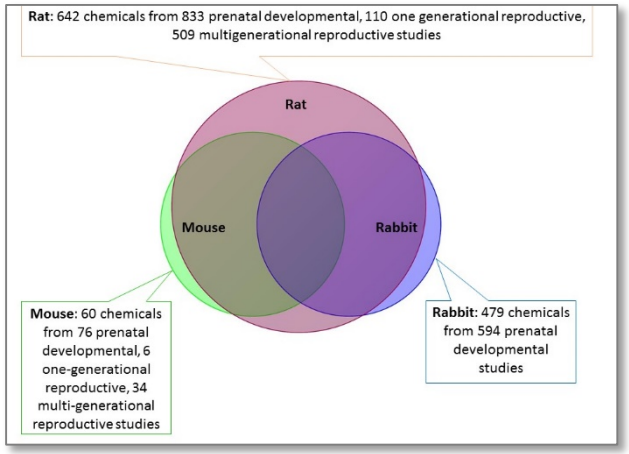
FILTER: Study types associated with prenatal development/ developmental and reproductive
(Returns 896 chemicals across 2747 studies)

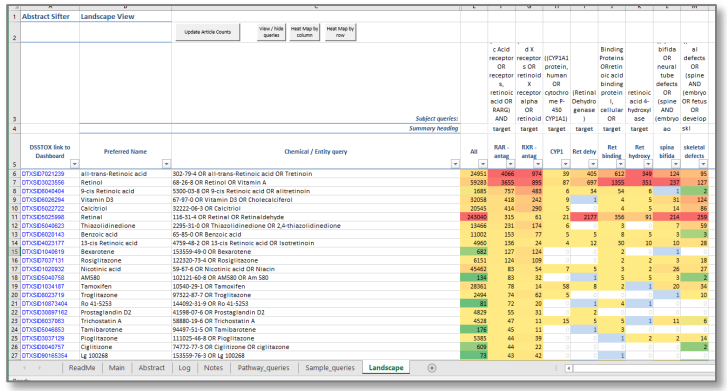
↓

POSITIVES: Identify Studies with skeletal developmental defects (Appendicular, Axial, and Cranial)
(returns 369 chemicals (41% of 896) across 2592 studies)

↓

Limit to Chemicals with limb developmental defects
(returns 44 chemicals (4% of 896) across 310 studies)

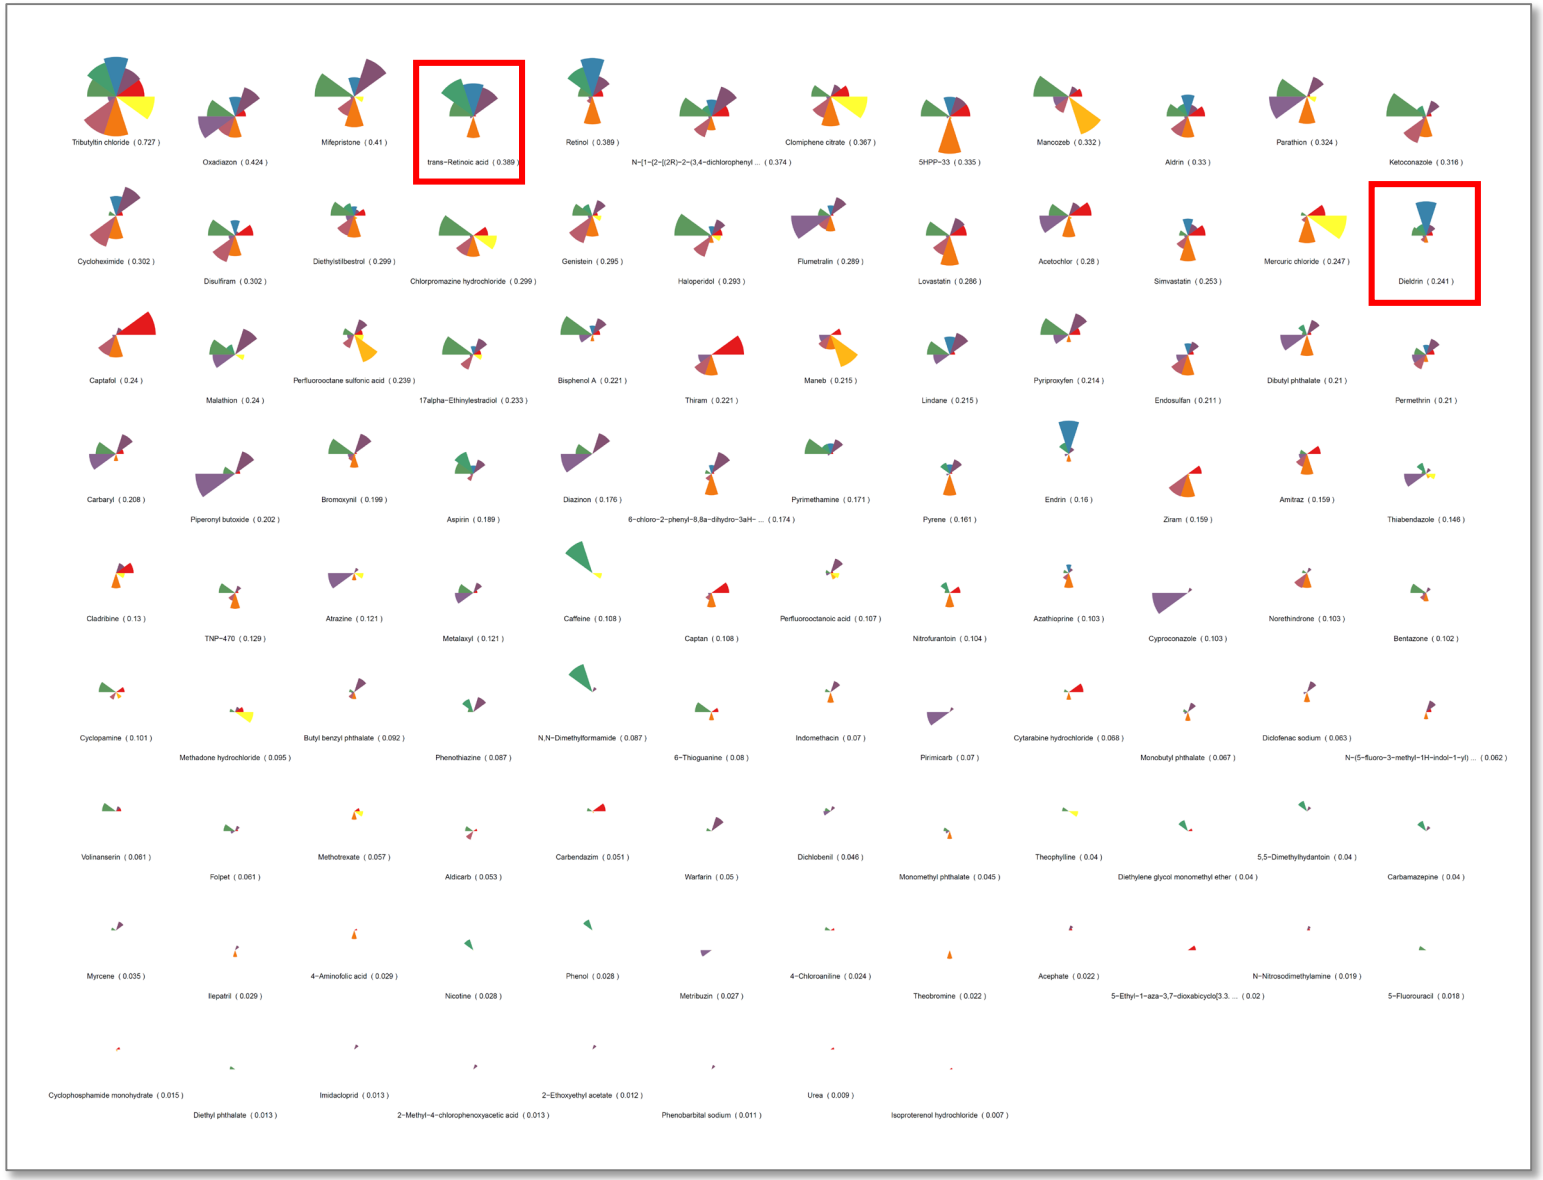


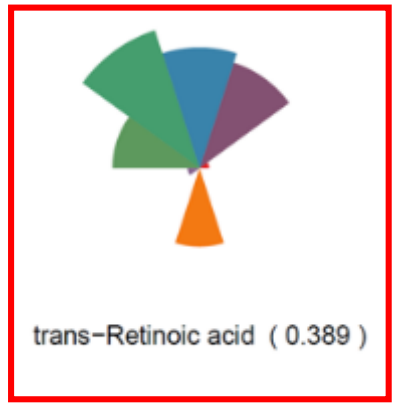


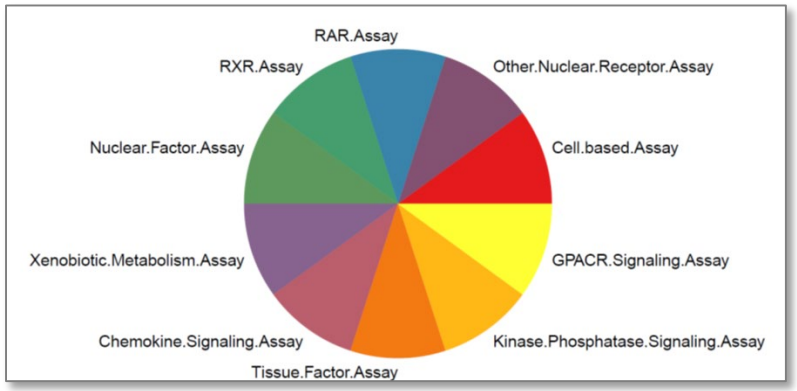
Literature supplement = 104 ToxCast chemicals associated with limb defects

SOURCE: Ahir et al., manuscript

ToxPi ranking: univariate features correlating statistically with skeletal (limb) defects

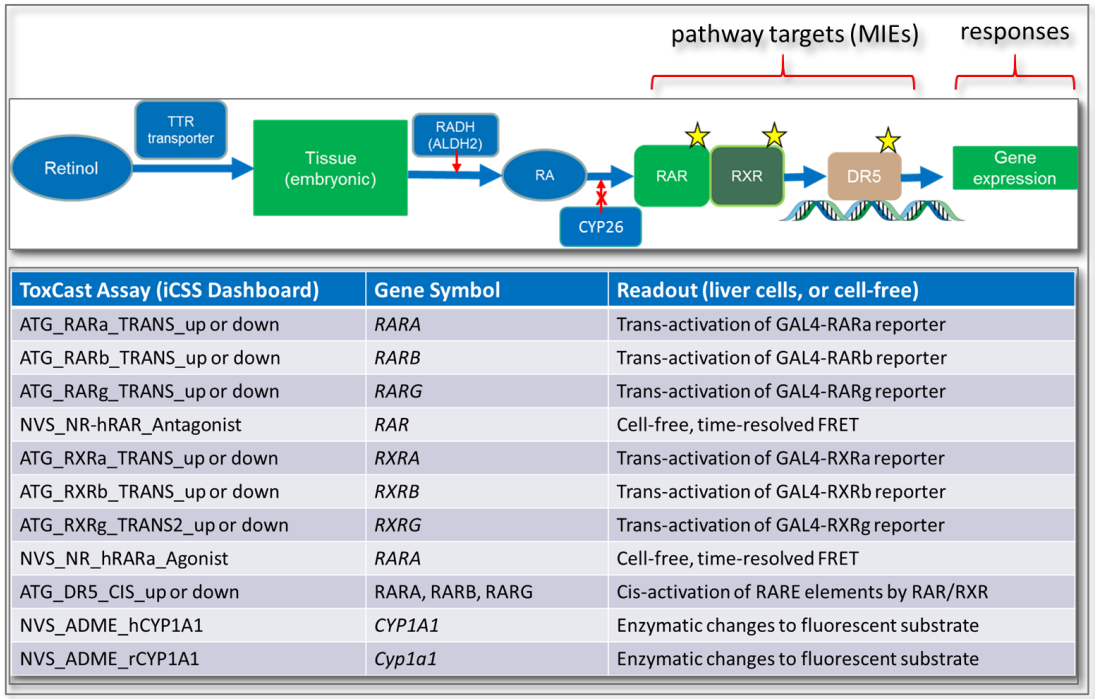






104 chemicals hit ~90 assays, with **RAR-RXR-DR5** well represented

HTS and qHTS



ToxCast Assay (iCSS Dashboard)	Gene Symbol	Readout (liver cells, or cell-free)
ATG_RARa_TRANS_up or down	*RARA*	Trans-activation of GAL4-RARa reporter
ATG_RARb_TRANS_up or down	*RARB*	Trans-activation of GAL4-RARb reporter
ATG_RARg_TRANS_up or down	*RARG*	Trans-activation of GAL4-RARg reporter
NVS_NR-hRAR_Antagonist	*RAR*	Cell-free, time-resolved FRET
ATG_RXRa_TRANS_up or down	*RXRA*	Trans-activation of GAL4-RXRa reporter
ATG_RXRb_TRANS_up or down	*RXRB*	Trans-activation of GAL4-RXRb reporter
ATG_RXRg_TRANS2_up or down	*RXRG*	Trans-activation of GAL4-RXRg reporter
NVS_NR_hRARa_Agonist	*RARA*	Cell-free, time-resolved FRET
ATG_DR5_CIS_up or down	RARA, RARB, RARG	Cis-activation of RARE elements by RAR/RXR
NVS_ADME_hCYP1A1	*CYP1A1*	Enzymatic changes to fluorescent substrate
NVS_ADME_rCYP1A1	*Cyp1a1*	Enzymatic changes to fluorescent substrate

- ToxCast has a number of ligand-binding and reporter assays for retinoid coverage.
- Obvious omissions for RDH/RALDH2 and CYP26 a/b/c (surrogate Cyp1a1 biochemical assay).

ELSEVIER

Identification of compounds that modulate retinol signaling using a cell-based qHTS assay

Yanling Chen [a,*], Srilatha Sakamuru [b], Ruili Huang [b], David H. Reese [a], Menghang Xia [b]

[a] Division of Molecular Biology, Office of Applied Research and Safety Assessment, Center for Food Safety and Applied Nutrition, U.S. Food and Drug Administration, Laurel, MD 20708, United States
[b] National Center for Advancing Translational Sciences, National Institutes of Health, Bethesda, MD 20892, United States

- NCATS established the C3RL4 reporter gene cell line which contains a functional retinoid signaling pathway;
- firefly luciferase reporter gene (Luc) engineered under control of RARE;
- screened a library of 1280 pharmacologically active compounds in both agonist and antagonist modes;
- have run the Tox21 library (some of that data in Wei et al. 2019, in press).

- 97 of 1858 chemicals (5.2%) registered an AC50 $\leq$ 2 µM in one or more relevant assays
- some persistent organic pollutants preferentially activated RARs (eg, aldrin, dieldrin, endrin, endosulfan)
- some tert-butyl compounds and organotins preferentially activated RXRs (eg, butylphenol, tributyltin)
- in addition to above, some mitochondrial disrupters displayed activity on DR5 (e.g., strobins, rotenone)
- others: retinoids (atRA, retinol), anticonvulsants (VPA), triazoles (fluconazole), flame retardants (PBDEs), …

Pregnancy dosimetry

- To learn the HTTK model, case study was applied to 7 retinoid analogs to determine real-world exposure scenario for respective T.I.s reported in the iPSC DevTox^{qP} assay by Palmer et al. 2017.

- Such analysis underway for the Tox21_VPA & Tox21_NTP iPSC series, linking the T.I. concentration to maternal dosimetry reflective of exposure during the critical developmental toxicity window.

Summary: *scoping the system for predictive toxicology toward developing guideline testing strategies or IATA/Defined Approaches …*

- Although skeletal defects are common outcomes in experimental and clinical retinoid perturbation, the sensitive biology is on early patterning of the body plan.
- HTS profiling (ToxCast) identifies aspects of the RA pathway in statistical correlation models associating *in vitro* bioactivity with skeletal defects.
- Mechanistic data and information for chemicals that interact with retinoid pathway targets can be framed into various AOPs.
- Computational intelligence may help isolate human-relevant inputs and downstream events during uncontrolled RA signaling invoked with chemical exposure.
